2
3 SPECIAL MASTER HASTINGS: Let's go on the
4 record. Good morning to all of you. My name is
5 George Hastings, and I'm a Special Master of the
6 United States Court of Federal Claims. To my left is
7 Denise Vowell, Special Master of the Court of Federal
8 Claims, and to my right is Patricia Campbell-Smith, a
9 third Special Master. Together we'd like to welcome
10 you all to a special evidentiary hearing of the United
11 States Court of Federal Claims.

12 Today we are here for two purposes. One
13 purpose is to hear the claim under the Vaccine Act of
14 Michelle Cedillo. Michelle is a 12-year-old who lives
15 in Arizona and who has been diagnosed with autism and
16 a number of other medical conditions. The first
17 purpose of this hearing is determine whether
18 Michelle's own autism and her other conditions were
19 vaccine caused.

20 However, there is another equally important
21 purpose for this hearing. That is, Michelle is one of
22 nearly 5,000 children diagnosed with autism or similar
23 disorders who have filed compensation claims under the
24 Vaccine Act. These 5,000 claims have been grouped
25 together in a joint proceeding known as the Omnibus

1 Autism Proceeding.

2 The committee of attorneys who represent the
3 Petitioners in the Omnibus Autism Proceeding has
4 designated Michelle's case as the first test case in
5 that proceeding. Therefore, in this hearing today and
6 over the next three weeks we will hear not only about
7 Michelle's own condition, but also extensive expert
8 testimony concerning the Petitioner's first general
9 causation theory; that is, the general theory that MMR
10 vaccines and thimerosal-containing vaccines can
11 combine to cause autism.

12 These two purposes explain why up here on
13 the bench you see three Special Masters, not just one.
14 Under the Vaccine Act, individual claims are to be
15 decided by a single Special Master, and I am the
16 Special Master who has been assigned the particular
17 case of Michelle Cedillo so that I alone will decide
18 Michelle's own particular case.

19 The other two Special Masters sitting up
20 here with me on the other hand are here in order to
21 hear the general causation testimony to be presented
22 during this hearing. Those two Special Masters will
23 then apply that general causation testimony to other
24 individual Vaccine Act cases that are assigned to
25 them.

1 I want to begin this hearing then by
2 acknowledging the most important people who are in the
3 courtroom today, the Cedillo family. With us here
4 today, although they will be in and out of the
5 courtroom on account of Michelle, are Michelle Cedillo
6 herself, her mother, Theresa Cedillo, and Michelle's
7 father, Michael Cedillo. I understand and I met this
8 morning several other family members who are with us
9 today. We thank the Cedillos for being here with us.

10 Also on behalf of myself and my colleagues,
11 I wish to extend our sympathy to Michelle and her
12 family for all they have been through. Clearly, the
13 story of Michelle's life is a tragic one. She and her
14 family have been through some very difficult times and
15 they are deserving of sympathy, but also deserving in
16 my mind of admiration for the way they have coped with
17 Michelle's illness.

18 We thank the Cedillo family for very
19 generously agreeing to have Michelle's case designated
20 as the first test case in the Omnibus Autism
21 Proceeding. Theresa Cedillo will herself be
22 testifying in this hearing, probably later today.
23 Again, we thank all of the Cedillos for their
24 participation in this hearing.

25 We also wish to thank the counsel for both

1 sides who will be presenting their evidence during
2 this hearing. We know that they have worked
3 enormously hard to prepare for this hearing, and we
4 appreciate that hard work. We also thank the expert
5 witnesses who have agreed to testify before us.

6 We thank the Judges of the U.S. Court of
7 Appeals for the Federal Circuit who have generously
8 allowed us to take over their largest courtroom for
9 the next three weeks. We thank the United States
10 Marshals and all of the other wonderful employees of
11 both of the Courts housed in this building, especially
12 Brian Bishop and Don Palmer, who have assisted us very
13 ably in preparing for and conducting this hearing.

14 Next, I want to mention some other people
15 who are also very important to this proceeding. That
16 is the families of all the other 5,000 Vaccine Act
17 claimants who have been diagnosed with autism or
18 similar conditions.

19 Some of those families I think are in the
20 courtroom with us here today, and we extend to such
21 families a very special welcome. Some others of those
22 families are listening in now by our special
23 teleconferencing system or they intend to listen to
24 the audio portion of this hearing by downloading it
25 from the internet.

1 To all such family members, as to the
2 Cedillo family, we three Special Masters pledge to you
3 that we will listen very carefully to the evidence put
4 before us at this hearing and give that evidence our
5 very complete and careful study. We realize what a
6 very important task has been assigned to us in
7 deciding these cases, and we will give our greatest
8 effort in carrying out that heavy responsibility.

9 Finally, for those of you who will be here
10 or listening to this hearing for more than just today,
11 I'd like to give you a brief road map of the
12 proceedings. We will begin at 9 a.m. Eastern time
13 each day. We will take a lunch break of about one
14 hour probably sometime about 1 p.m. We will adjourn
15 each day probably sometime around 6 p.m., but
16 sometimes earlier or later depending on the witness
17 schedule.

18 Please, all of you with cell phones, please
19 do turn them off.

20 With that, we are ready to begin the
21 proceedings I believe. We are going to start with
22 opening statements by counsel for the Petitioners.
23 Which of you will be starting, Mr. Powers?

24 MR. POWERS: Special Master, I will be
25 starting, and Ms. Chin-Caplan will be giving an

1 opening specific to the test case.

2 SPECIAL MASTER HASTINGS: Okay. Mr. Powers
3 will make an opening statement on behalf of the
4 Petitioners Steering Company. Mr. Powers, please go
5 ahead.

6 MR. POWERS: Thank you, Special Masters, and
7 good morning, counsel, folks in the room and folks
8 listening over the web and folks who will be listening
9 later.

10 My name is Tom Powers. I'm one of the
11 attorneys on the Petitioners Steering Company. It's a
12 group of lawyers who represent the 4,800 plus
13 claimants in the Omnibus Autism Proceeding. It's a
14 privilege to represent these families, and it's a
15 privilege to work on behalf of the attorneys that are
16 representing those families individually.

17 I'm here today to describe from the
18 Petitioners' point of view three main things. The
19 first is from the Petitioners' perspective why we're
20 here and how we got here. The second is to describe
21 what's happened over the past five years in the
22 omnibus proceeding, and the third is to talk about the
23 expectations from today and moving forward.

24 First off, the reason that we're here today,
25 as Special Master Hastings has already described, is

1 that we're going to hear one test case. It's the
2 first of a series of test cases.

3 This is a test case by the Cedillo family
4 that's going to address general issues of causation on
5 the theory of causation that thimerosal-containing
6 vaccines caused immune system problems and suppression
7 that makes certain children vulnerable or susceptible
8 to viral infections that can cause neurological
9 injuries, including many of the symptoms of autism,
10 and that the MMR in particular is a viral agent that
11 has caused autism in a number of these children,
12 including in Michelle Cedillo.

13 If you notice from that description, it's
14 not a test case today about the medical or scientific
15 theory that thimerosal in and of itself has neurotoxic
16 or other properties that in and of itself can cause
17 these injuries. There will be later test cases
18 addressing that theory, so this test case is
19 addressing one particular theory of causation.

20 Why are we here? Well, we're here for
21 several reasons. One of the main reasons we're here
22 is that Congress said claims like this need to come
23 here. They need to come into the Vaccine Program.
24 They need to come into the Vaccine Program because
25 Congress faced a crisis in the 1980s. Vaccines were

1 causing a significant number of very serious injuries
2 in the pediatric population. A lot of injured kids
3 were having extremely bad reaction to certain
4 vaccines.

5 To get compensation, those families had to
6 go through the civil litigation process. That's a
7 highly adversarial, extremely time consuming,
8 remarkably expensive process. Congress decided as a
9 matter of policy, and we are not here to debate the
10 policy, but Congress decided and has resolved that as
11 a matter of policy there were three goals in setting
12 up the Vaccine Program.

13 The first was to protect manufacturers from
14 civil liability. The second was to encourage vaccines
15 to be used and administered and developed, and the
16 third was to provide a fair, just, speedy and generous
17 compensation program for those children, hopefully a
18 small number, ideally rare, but expected adverse
19 reactions to vaccines.

20 That's the program's goal and so children
21 who are injured by a vaccine need to come to this
22 program, and that's where they are today, the Cedillo
23 family and the other families in the omnibus.

24 Now, the omnibus proceeding itself is
25 created because of the sheer number of claims. As the

1 Special Master described, nearly 5,000 claimants who
2 allege that thimerosal, the MMR or a combination of
3 them caused these serious injuries.

4 These are families, and it's important to
5 understand this. These are families who followed the
6 rules. These are the families that brought their
7 children in for pediatric vaccines. These are the
8 families that immunized their children.

9 The public policy decision on mass
10 immunization is a tradeoff. It is expected that there
11 will be -- again, hopefully rare and infrequent, but
12 expected that there will be -- severe adverse
13 reactions when millions and millions of children every
14 year are being given millions and millions of
15 pediatric vaccines.

16 The idea, and it's a social compact. The
17 social compact is that families individually assume an
18 extremely tiny risk of harm for the greater good, and
19 it's an important social compact. It's a social
20 compact that's based on trust. It's based on the
21 families, and these families have trust.

22 It's based on the trust that the vaccines
23 being used are as safe as they can be, and it's based
24 on trust that if an individual family suffers a
25 serious injury there will be a fair compensation

1 system that they can go to.

2 These are the families that trusted the
3 system, and these are the families that followed the
4 rules, and these are the families that suffered injury
5 for the greater good.

6 There's no doubt that mass immunization
7 programs are a great public benefit. They have
8 prevented huge numbers of infectious diseases and
9 prevented tens of thousands of deaths and serious
10 injuries that historically individuals in society have
11 had to bear the burden of, but these are the families
12 participating in that program again, trusting in the
13 program, who are now here seeking compensation because
14 they unfortunately were the ones that got hurt.

15 It's important to remember that this is a
16 no-fault system, so in this test case and in the other
17 test cases that you'll hear it's not about did anybody
18 do something wrong. It's not about negligence. It's
19 not about liability. It's about proving by a
20 preponderance of the evidence more likely than not
21 that thimerosal, that MMR, a combination of the two,
22 caused or was a substantial contributing cause for the
23 serious injuries that these children have suffered.

24 It's important also to remember the legal
25 standard and what Congress wanted and what case law

1 says will apply here; that close calls -- close calls
2 -- on causation ought to go to the Petitioner. Again,
3 that's to provide a just, fair compensation system for
4 the inevitable injuries that are going to result from
5 mass immunization programs.

6 It's not scientific certainty because,
7 frankly, the science is in dispute. That's what
8 you're going to hear in these three weeks, and that's
9 what you're going to hear in all the test cases. The
10 science is in dispute, and this issue is not
11 scientific certainty. It's more likely than not on a
12 balance of the evidence.

13 What this is not about is antivaccines. I
14 can tell you that as somebody representing these
15 injured families and talking to a lot of these
16 families, it is shameful frankly some of the
17 institutional disinformation and distortion that you
18 hear.

19 Whether it comes from industry, from the
20 pharmaceutical industry, from the HMOs, from the
21 medical establishment or from the government itself,
22 from government agency spokespeople, saying that these
23 families are out to sink the Vaccine Program and these
24 families are antivaccine, that these families think we
25 should not have shots to protect people from

1 infectious diseases, and that is disinformation.

2 That's distortion. That isn't true, and it's
3 shameful.

4 I want to talk about what's happened in the
5 five years since this proceeding began. General Order
6 No. 1 in July 2002 set up the Omnibus Autism
7 Proceeding. The dynamic has been from day one, and
8 even from before the omnibus was set up, that you have
9 the Respondent, the Department of Justice, really
10 acting as the attorneys for the Respondent, the
11 federal Department of Health and Human Services, but
12 when it comes down to it it's the federal government.
13 The federal government is the Respondent in these
14 cases.

15 From day one, the Defendant and industry
16 have been on the same side of the table standing
17 shoulder-to-shoulder doing everything they can to make
18 sure that this climb towards proving causation is as
19 long and as steep and as hard as it can possibly be.
20 Numerous obstacles that I'll describe in detail have
21 been placed in the path of the Petitioners seeking
22 that fair, speedy, generous, expeditious compensation
23 that Congress said they're entitled to.

24 Way back in 2002 before this process was set
25 up -- the vaccine Court was here, but the omnibus

1 wasn't -- some families had filed lawsuits in the
2 civil justice system asking Courts and particularly
3 asking juries to decide the issue of whether they had
4 been injured by vaccines, suing the pharmaceutical
5 industry and the vaccine manufacturers directly.

6 Well, as one would expect, and I filed one
7 of these cases in Portland, Oregon. As one would
8 expect, and I totally expected it, pharmaceutical
9 industry lawyers were on the other table telling the
10 Federal Judge to dismiss the case and send these
11 children out of the courthouse. They shouldn't have a
12 claim in front of a jury, and they should instead come
13 to the Vaccine Program.

14 What I didn't expect then was that the U.S.
15 Government would stand literally physically shoulder-
16 to-shoulder with industry telling a U.S. District
17 Court Judge that these children ought to be tossed out
18 of Federal Court and that they ought to come here,
19 taking the same side as industry from day one, and
20 that continued through the course of the program.

21 It took a long time to get the omnibus
22 proceeding set up, and credit I think goes to the
23 Special Masters, the Special Masters here and the
24 Chief Special Master, who really were fairly creative
25 and designed a proceeding that can accommodate a huge

1 caseload of related claims and set up the omnibus
2 proceeding.

3 DOJ fought at several key steps in the way
4 to implement that proceeding. For example, the
5 Special Masters decided that with 4,800 claims coming
6 into the program with a statute of limitations and
7 radically unfair, Draconian short statute of
8 limitations that cuts off a lot of claims before the
9 families even know they have a claim, with the clock
10 running on those claims that there would be a rush to
11 get cases filed in this program and so they provided a
12 very simple mechanism to let families do that in a
13 quick, easy, inexpensive way.

14 Rather than having to quickly file full sets
15 of medical records and expert reports and affidavits,
16 to fill out a short form petition to stop the clock on
17 their claim and get a place in line in the program.
18 DOJ fought that.

19 DOJ resisted that, and even though they lost
20 on that issue for those families who are here and
21 those families listening to this broadcast, you all
22 have received that letter from your federal government
23 saying you haven't done what you need to do in our
24 opinion, and your claim is subject to dismissal,
25 fighting every step of the way again families who

1 played by the rules.

2 These families filed their claims like they
3 were told to do. They relied on what the Special
4 Master said would be the process, but they still get a
5 letter saying well, you haven't done what you need,
6 and we're reserving our right to toss your case out.
7 That's just not right.

8 Something else that we've seen happen in the
9 last five years in this program is a simple inability
10 to get important, critical information and evidence
11 that these Petitioners need to prove individual cases
12 and to prove general causation.

13 In the civil justice system there's a
14 process called discovery. It's available as a matter
15 of right. If a party to litigation believes that
16 somebody on the other side of the litigation has
17 relevant information, material information, they're
18 entitled to simply ask for it and they get it, and if
19 they don't get it the Judge tells the other side
20 you've got to cough it up.

21 There's no right of discovery in the
22 program. The parties, and I'm speaking for the
23 Petitioners. The Petitioners don't have the right to
24 simply ask for and receive from the other side, from
25 the federal government, important information about

1 the science and the medicine in these cases.

2 That's an unusual situation when you look at
3 the facts in this litigation and the facts related to
4 the Vaccine Program. A lot of the evidence and a lot
5 of the information on the science and the medicine is
6 controlled by the federal government; in fact, even
7 generated by the federal government.

8 The federal government funds studies. The
9 federal government actually conducts studies among its
10 various client agencies and client entities looking at
11 this issue, developing information, developing facts,
12 developing things that would potentially be evidence,
13 but we can't get them. They have it. They're
14 generating it, and we largely cannot get it.

15 For virtually every bit of information that
16 we've received, the Petitioners have received from the
17 Respondent, we've had to litigate. Special Master
18 Hastings has been on this case for five years from day
19 one, and we for years have been having to put in front
20 of him motions to compel, motions demanding that the
21 Special Masters force the Department of Justice to
22 turn over important, relevant information.

23 Information about studies that the
24 government is doing, information about studies that
25 the government has planned, things that one would

1 normally get again in civil litigation as a matter of
2 right.

3 If they're going to rely on a study, we want
4 it, and we ask to have the files of the investigators
5 to look at the data, the actual data that the
6 investigators used, to even take the depositions of
7 the investigators to really sort of look and see if
8 those studies are legitimate, if those studies hold
9 water and if they're relevant to get that information.

10 It's not just for our benefit. It's for the
11 benefit of the Special Masters because absent a jury
12 the Special Masters will be deciding these cases, and
13 our position has always been that to make the best
14 decision you need the best information. Transparent,
15 open, acceptable, available to both sides, not just to
16 one side. We've had to fight those motions for the
17 last five years.

18 One big area where we sought information is
19 related to the Vaccine Safety Datalink. The Vaccine
20 Safety Datalink is a huge database involving millions
21 of children, and it gives you a unique opportunity to
22 match the vaccine exposures of groups of children
23 against their medical outcomes, an extremely powerful
24 database.

25 This is probably, as various government

1 entities have described it, perhaps the richest source
2 of information, the richest source of data that would
3 allow people to do population studies to determine
4 whether there are associations or causal associations
5 between various vaccine exposures and various health
6 outcomes. We've been fighting for three and a half
7 years to get access to the Vaccine Safety Datalink and
8 have been frustrated in all of those efforts.

9 In 2002, the Vaccine Safety Datalink that
10 the federal government had administered and managed
11 for many years was outsourced, so by the time we were
12 asking to get access to the Vaccine Safety Datalink
13 the federal government was able to say well, we don't
14 possess it anymore. It's not ours anymore.

15 Where is it? Well, it was outsourced with
16 the promise of \$200 million over the course of 10
17 years to manage it to the national trade association
18 for the health insurance companies, for the HMOs.

19 Public resource, a rich source of
20 information that addressed critical issues of fact and
21 public policy relating to vaccine safety, and that
22 database is locked up and the government has hidden
23 the key. We have been fighting to get that, and we're
24 going to continue fighting to get that.

25 During the course of this litigation

1 Petitioners have also gone to industry as a third
2 party, although industry is completely protected from
3 any liability in this system. As the people who
4 designed, tested, manufactured and distributed these
5 products, we thought as a matter of common sense that
6 it might make sense to get information about the
7 safety of their products from the manufacturers.

8 Again, the vaccine industry and their
9 lawyers intervened several times. Even though they
10 cannot be liable in this program, they still show up
11 to argue why they shouldn't simply have to give
12 information and provide information that again would
13 be made available as a matter of course in civil
14 litigation.

15 It's another example of the federal
16 government and industry standing side-by-side,
17 shoulder-to-shoulder, standing between the Petitioners
18 and important relevant information and keeping that
19 information from the Special Masters to boot.

20 Now, the Department of Justice is I think
21 somewhat proud of having produced some documents, a
22 couple of hundred thousand pages of documents. It's
23 important to understand what those documents are.
24 Those are product license applications. About 98
25 percent of the documents produced by the federal

1 government to the Petitioners in this litigation are
2 those PLAs as they're called for short.

3 Again, you've got the government and
4 industry working together because those PLAs are
5 materials that are submitted by the manufacturers to
6 the FDA to get products approved, to get warning
7 labels approved, to get licenses approved, to sell and
8 distribute their biological products.

9 So it's industry information held by the
10 government, and when we get it well, industry has had
11 a chance to sit down with government lawyers and
12 redact and white out and black out huge chunks of
13 information, trade secrets, proprietary information,
14 all sorts of things that they claim are confidential
15 and privileged and protected and have to remain
16 secret.

17 Now, Petitioners didn't even get a chance to
18 look and see whether any of those claims of privilege
19 are true. That was done again by industry lawyers and
20 the government lawyers working together. So what we
21 have are a couple of hundred thousand pages of heavily
22 redacted, often blank documents largely irrelevant to
23 the issues here.

24 It's a mountain, a haystack in search of a
25 needle. There's not a needle in there as far as I can

1 tell. It took three years to get there too.

2 Finally, in talking about the discovery
3 process and the search for information, three years
4 ago the Petitioners realized that in England, in the
5 United Kingdom, there was litigation going on that
6 involved the MMR -- not thimerosal, but the MMR -- and
7 it was litigation that had proceeded for a couple of
8 years generating a huge amount of material and in
9 particular generating dozens of expert reports, expert
10 reports from both sides of the issue.

11 Recognizing it makes sense to not have to
12 reinvent the wheel if you've got 50 plus expert
13 reports from litigation that has been going on for a
14 few years looking at some of the some fact issues we
15 knew would present themselves in this litigation, we
16 asked the Special Masters to subpoena from the
17 manufacturers copies of those expert reports.

18 We weren't asking them to go out and
19 generate new reports and spend a bunch of money to
20 hire people and write summaries and interview
21 witnesses. We were simply asking for copies of what
22 had already been developed and produced in the U.K.
23 litigation.

24 Of course, industry resisted. The Special
25 Masters did not issue a subpoena. We never saw that

1 information, but we find out a couple of weeks ago
2 that the federal government -- your federal government
3 -- headed over to the United Kingdom. They headed
4 over to the United Kingdom, and they asked under a
5 new, special procedure that the British Courts have, a
6 procedure apparently not in place when Petitioners
7 were making their request.

8 Your federal government went to the U.K. and
9 asked that selected documents over there be unsealed
10 because all of these reports are subject to a
11 protective order by the British Court under British
12 law. It got to the point where less than a week
13 before trial here apparently reports from the U.K.
14 were coming back to the government.

15 Now, it wasn't all 65 reports. Apparently
16 it wasn't an application to say let us see everything
17 in this important litigation to really air these
18 issues out and provide the facts that the Special
19 Masters and the parties are going to need to make a
20 better decision for all these kids on these important
21 claims. What was being brought over ultimately were
22 cherry-picked documents that are going to help
23 supposedly the Respondent's side of the case.

24 Now, when those documents come in, if they
25 ever come in, is going to be an issue and has been an

1 issue of debate. Petitioners obviously believe that
2 some of these documents shouldn't even come in, at
3 least in the Cedillo case here, because they are so
4 late and so voluminous, and my understanding is some
5 of them might not be introduced here, but may be
6 introduced in other test cases down the road.

7 No coincidence that at the same time your
8 federal government was applying in the U.K., one
9 government to another, industry was over there asking
10 for the same thing. Industry was over there asking
11 the British Court to unseal documents, selective
12 documents that could be used against some Petitioners
13 who left this program following the rules and have
14 civil cases pending in Federal Courts in the United
15 States.

16 Again, industry and government, shoulder-to-
17 shoulder, side-by-side, cherry-picking information to
18 use to do anything they can to further their common
19 goal of denying compensation to these children,
20 denying compensation to these families and making sure
21 that these folks don't have the evidence they need to
22 move forward and put on the best possible case.

23 Now, a lot of people have asked why has it
24 taken so long to get this first test case teed up
25 here? Five years, almost five years. We're one month

1 short of when the general order was entered creating
2 the omnibus.

3 I think there are two reasons. The first is
4 that the science has been evolving. When these first
5 claims were filed, individual claims back in 2000,
6 2001, 2002 and back when the omnibus proceeding was
7 set up in the middle of 2002, the science was new, and
8 there was a lot of investigation and research going on
9 by universities, by private researchers, by the
10 government, probably even by industry.

11 The government's own science, by the way, is
12 still a work in progress. We know that there are case
13 control studies, for example, that are looking at a
14 possible relationship and association between
15 thimerosal and neurological injuries. The government
16 has been investigating that for years. We're here
17 five years after the omnibus, and that still isn't
18 published.

19 There was a study by the CDC looking at
20 Italy, looking at unexposed and exposed cohorts of
21 children to again investigate the hypothesis that
22 thimerosal might be associated with neurological
23 injuries. Haven't seen that study yet either. Still
24 in progress.

25 Another case control study in the United

1 States looking specifically at an association between
2 thimerosal and autism spectrum disorders. Haven't
3 seen that study yet either.

4 These studies and other studies, the ongoing
5 science, that was the main reason that the
6 Petitioners, when we realized that there's science
7 about to come out, have asked the Special Masters to
8 allow that science to ripen, again so that they can
9 make the best decision possible for this large number
10 of very serious injury claims.

11 The science has been moving at pace, but
12 science and the law I think both have a tendency to go
13 fairly slowly, and when you combine them and you have
14 that interface between science and the law it takes a
15 while, but it's okay to take a while to make the best
16 decision, and that's been the Petitioners' position
17 all along.

18 It's also extremely important to understand,
19 and I've heard Respondent make the argument well, you
20 don't really need discovery and you don't need a lot
21 of the things that you've been asking for because when
22 you filed those cases you knew what your theory was,
23 and you ought to be able to move ahead and prove your
24 theory without waiting to get all this information
25 from industry or from us.

1 Well, you need to understand that having
2 enough information to lead you to file a case is not
3 the same thing as meaning you have all the evidence
4 you need to try the case, and that's especially
5 important when you remember the statute of
6 limitations.

7 These injured kids and their families had
8 three years from the date that the very first symptom
9 appeared to file a claim in this program, even if at
10 that time they had no idea that it was a symptom of
11 autism, even before sometimes autism was diagnosed,
12 even if they were told by their doctors or other
13 health care providers that no, the vaccines had
14 nothing to do with it.

15 That clock started running for a lot of
16 these families before they knew it, and your federal
17 government, through the Respondent here, will look at
18 these cases with 20/20 hindsight. They will go look
19 at medical records, and they will go as far back in
20 time as they can to see something that they can argue
21 is that first symptom, and then it's gotcha. Gotcha.

22 That symptom happened three years and a day
23 before you filed your claim, and you're going to be
24 dismissed. If you're dismissed, you have nowhere to
25 go. Nowhere to go. So of course these families filed

1 their claims before they were ready to try their case,
2 and it's taken these years under that pressure of the
3 statute of limitations with the developing science for
4 these test cases to be ready to go.

5 The other reason it's taken so long I've
6 already described. Information that would have been
7 available as a matter of right is something that we
8 have had to fight for for the last five years and have
9 met resistance and obstacle at every step of the way.
10 So that's where we are, and that's how we got here.

11 I want to talk about where we're going from
12 here. I've talked a lot about industry. I've talked
13 a lot about the Respondent and the government, but, as
14 Special Master Hastings said in his introduction,
15 those folks ultimately are not who are important here.
16 The lawyers are not important, and, with all respect,
17 the most important people are not the Special Masters.

18 The most important people here are the
19 families, including folks like the Cedillos. These
20 are families, as I said, who have played by the rules.
21 They participated in immunization programs. They
22 assumed the risk. They got injured for the common
23 good, and we need to remember that.

24 They played by the rules by filing their
25 claims in the program. They played by the rules

1 waiting for the science and the evidence to develop so
2 that they can put on a science-based case in this
3 omnibus proceeding, and they've played by the rules by
4 waiting it out.

5 These are families that in many cases have
6 shown incredible fortitude, and it's a privilege to
7 represent them. Support groups, support networks,
8 family groups, medical providers willing to go out on
9 a limb to do what they can for their kids.

10 They haven't given up on this system. They
11 have not given up on this system, and that's why
12 they're here. As we move forward, just as they
13 haven't given up on their own kids and they haven't
14 given up on the system, they haven't given up on the
15 hope that they're going to be treated fairly, that
16 these proceedings moving forward will be open, that
17 they'll be transparent, that they'll be fair.

18 They have the hope that justice will be had.
19 They expect nothing more, and they deserve nothing
20 less. Thank you.

21 SPECIAL MASTER HASTINGS: Thank you, Mr.
22 Powers.

23 I now understand Ms. Chin-Caplan will make
24 an argument specifically on behalf of the Cedillo
25 family.

1 MS. CHIN-CAPLAN: Special Master Hastings,
2 Special Master Vowell, Special Master Campbell-Smith,
3 my name is Sylvia Chin-Caplan, and I, along with my
4 partners, Kevin Conway and Ron Homer, represent
5 Michelle Cedillo.

6 I'd like you to know who Michelle is because
7 her life has been very short, but yet it's been
8 fraught with health care issues and certainly not one
9 that a normal child would ever want or that parents
10 would ever want for their child.

11 Michelle was born on August 30, 1994. She
12 weighed eight pounds roughly, and her Apgars were nine
13 and nine. In other words, she was perfectly healthy.
14 On day one when she was born she received a hepatitis
15 B immunization, and it contained 12.5 micrograms of
16 mercury. Her parents didn't know about it. The
17 majority of the health profession didn't know about
18 it.

19 Michelle went to her regular doctor's
20 visits. Her parents, this was the first child. This
21 was the only child. They wanted this child very
22 badly, and they were going to give her the very best
23 medical care that she could ever have.

24 They took her to her regular doctor's
25 appointments. They gave her all her immunizations

1 because that was what was recommended. They took her
2 when she was sick. They nurtured her because this was
3 their child, and they wanted the very best that they
4 could have for her.

5 So because they wanted the very best that
6 they could have for her they took her for her other
7 immunizations. One month after she was born, she went
8 for hepatitis B number two, another 12.5 micrograms of
9 mercury, so we now have 25 micrograms of mercury, a
10 cumulative dose, in a child who is only one month old.

11 And because they were such good parents they
12 took her for more immunizations. They took her for
13 her DPT and her HiB. Her doctors were very
14 knowledgeable. They didn't want her to get more shots
15 than she needed to get so she got a combined shot, a
16 DPT and HiB combined. That DPT and HiB combined also
17 contained mercury. It contains 25 micrograms of
18 mercury, so by the age of four months Michelle had
19 received 50 micrograms of mercury.

20 Now, there were other immunizations
21 recommended, and Michelle's parents knew this, and she
22 took them. They took her for her immunizations. In
23 October of 1994 she went for another series of
24 immunizations, and then she went for her DPT and HiB
25 again which contained another 25 micrograms of

1 mercury.

2 So by the age of approximately seven months
3 Michelle had received three DPT immunizations, she had
4 received three hepatitis immunizations, and each DPT
5 immunization combined with the HiB contained 25
6 micrograms, and each hepatitis B immunization
7 contained 12.5 micrograms. So you add up the math.

8 During this period of time Michelle seemed
9 to be okay. She was happy. She was interacting. She
10 was starting to walk. She was meeting her milestones.
11 Her pediatricians didn't think there was anything
12 wrong with her.

13 In December of 1995, Michelle went in for
14 another immunization, another regular scheduled
15 immunization. She went for her MMR. One week later
16 Michelle developed a fever of 105. Her mother called
17 the doctor, and she was told there's a flu going
18 around, a very bad flu. Keep her at home. Nurse her,
19 and she'll recover.

20 That fever stayed up there, 105 on
21 December 27, 105 on December 28, 105 on December 29,
22 105 on December 30, and yet she was told it's the flu.
23 Finally on December 31 it broke. It came down, and
24 her mother thought thank God, it's finally gone
25 because when she was having this fever she's not very

1 well at all. After this fever ended around
2 December 31 Michelle wasn't her usual self, but her
3 mother thought she's recovering from this fever so
4 let's give her some time.

5 Then the fever came back. It came back in
6 early January, around January 5, and as soon as it
7 came back her mother was on the phone calling the
8 doctor saying the fever has come back. They told her
9 to bring her in, and when they brought her in they
10 said it's sinusitis or the flu. They gave her some
11 antibiotics, and they sent her home.

12 That fever lasted about two days, and after
13 that Michelle's family noticed that she wasn't
14 speaking. She was totally silent. Before that she
15 had been interacting with her parents, with her
16 grandparents. She began interacting with her cousins.
17 She was babbling. She was reaching for her toys.
18 She was walking practically. She was sitting up by
19 herself.

20 She didn't do any of that. She suddenly
21 became silent. She became involved in a little world
22 of her own. She started engaging in repetitive
23 behavior. The family would say Michelle, Michelle.
24 She ignored them like she never heard them. Her
25 parents got really concerned, and they told the

1 doctors this. What you'll see is that the doctors
2 would say "has lost some words since the fever" and
3 nothing else.

4 Now, before this, during December in the
5 midst of these high fevers, Michelle started to vomit.
6 You have a high fever. You have a flu. You're going
7 to expect some nausea and vomiting and diarrhea.
8 Michelle started vomiting. She developed diarrhea.
9 She continued to vomit after the fever was gone. She
10 continued to have diarrhea after the fever was gone.
11 She had diarrhea for almost 32 weeks continuously, and
12 on this very day Michelle still has GI problems.

13 So when Michelle's parents took her in once
14 again at 18 months, because they're such good parents,
15 she was due for her immunizations again. They brought
16 her in, and Michelle received her fourth DPT vaccine.
17 Now, that DPT also contained 25 micrograms of
18 mercury.

19 At that time, Michelle's parents were told
20 to just watch her. If she has hearing problems, we'll
21 do a hearing test in the future. There's variation
22 within each child. Not every child will progress at
23 the same rate. Some are slower. Some are faster.
24 She should be okay. Her parents believed the doctors
25 because they're highly educated professionals, and

1 they want to take care of your children. Michelle's
2 parents believe that then. They believe that now.

3 So they watched and they waited. Theresa
4 asked everybody around here is this right? Is this
5 right? Why doesn't she answer when I call her? Why
6 is she playing by herself and she doesn't want to
7 interact with anybody else? Why does she clap? Why
8 does she engage in this repetitive behavior? Most of
9 all, why is she not talking? She talked before. Why
10 is she not talking now?

11 Finally when there didn't seem to be any
12 answers anywhere Michelle went to another pediatrician
13 who referred her to an adult neurologist. The adult
14 neurologist in his medical records took down her
15 history. He noted the high fevers, and in his notes
16 he said, "Probably post immunization reaction." It
17 could have affected her hearing. We don't know. She
18 was delayed, and he recommended that she get referred
19 for an evaluation.

20 In July of 1997, Michelle saw Dr. Roth
21 approximately 18 months after her MMR. Dr. Roth did
22 an evaluation, noted the history again of the high
23 fevers, and Dr. Roth made the diagnosis that Michelle
24 was autistic.

25 The Cedillos didn't know what autism was.

1 They were told that in all likelihood Michelle was
2 never going to be able to take care of herself, that
3 she was probably going to require
4 institutionalization, and they were told that they
5 should probably do it now.

6 Theresa and Michael Cedillo refused to
7 institutionalize the child. They vowed that this
8 child that they had wanted so very badly -- their one
9 child, their only child -- was going to be cared for
10 by them and their family at home, and they would
11 provide as much care as she needed for as long as they
12 could possible provide it to her.

13 Now, if this were the only problem that
14 Michelle had they could potentially manage, but over
15 the years as Michelle grew older her diarrhea
16 persisted and she developed these eating habits. She
17 wouldn't eat anything. She would hit herself in the
18 chest. She would hit herself in the head. She didn't
19 like new situations. She didn't want to go out of the
20 house.

21 When her parents tried to get treatment for
22 her -- they brought in ADA treatment -- Michelle
23 couldn't tolerate the fact that there were new people
24 coming into her life. Theresa started to home school
25 Michelle.

1 Now, whenever Theresa asked the doctors what
2 can I do, what can I do to make my daughter healthy,
3 what can I do to help her maximize her potential, what
4 can I do to ensure that she can speak, that she can at
5 least take care of herself, maybe be a productive
6 member of society, is that too much to ask? Her
7 doctors inevitably said there's nothing you can do.
8 She's autistic.

9 Theresa was not willing to accept that for
10 her one child, her only child. She was determined
11 that her child would progress as much as she could and
12 would be able to function to the best of her ability,
13 so she started searching on the internet.

14 She started searching for answers on the
15 web. She met other families, and she heard about
16 potential treatments coming out and doctors who were
17 potentially making some discoveries that could help
18 her, and then she learned that there were doctors in a
19 group called Defeat Autism Now! who were getting
20 together for a conference, and the public was invited
21 to listen to what these doctors had learned and were
22 hoping could potentially provide treatment for
23 Michelle.

24 You'll hear that Theresa went to this
25 conference, and she stood in the back of the room and

1 she listened to Dr. Wakefield talk. She stood in the
2 room, and she waited for him to finish speaking so
3 that she could catch him and try to get his attention
4 about helping her child.

5 You'll hear that he was leaving the room and
6 she's chasing him down to see if she can get answers
7 for her child because this was her one child. This
8 was her only child, and she was going to try and help
9 her to the best of her ability.

10 In searching the net, Theresa also came
11 across the fact that there was a secretin study going
12 on where she lived, and she managed to get Michelle
13 enrolled in the study. As part of the study, it was
14 required that she undergo an endoscopy. An endoscopy
15 is essentially you look at the GI tract from top to
16 bottom, but in Michelle's case they only did an upper
17 GI, so they looked at the top.

18 She underwent this procedure in 2000. What
19 they found was a Grade III ulcer between the stomach
20 and the esophagus. Her GI doctor at that point said
21 that's why she's hitting herself. That's why she's
22 hitting herself in the chest because that ulcer is
23 causing her so much pain. That's why she can't eat
24 because that ulcer is causing her so much pain.

25 So they treated her, and they did another

1 endoscopy. In that other endoscopy they found that it
2 had healed. Then they also decided that because she
3 was part of the study, the secretin study, they had to
4 do both an upper and a lower GI. They had to see
5 whether the secretin was helping or not.

6 At this lower GI that was performed in
7 January of 2002 her treating doctor at that time, the
8 gastroenterologist, took a gut biopsy. He took this
9 gut biopsy, and he sent it off to a lab called
10 Unigenetics in Ireland. Months later that biopsy came
11 back positive.

12 It was positive, but what do we know about
13 it? How are you going to treat it? Most of all, how
14 do you get rid of it? Maybe there's a chance for
15 Michelle. If you get rid of it, maybe she'll regain
16 function. Maybe she'll be able to be a productive
17 member of society. Maybe she'll be delayed, but maybe
18 she can talk again.

19 There were no answers out there. Michelle's
20 condition continued to worsen. She ended up in the
21 hospital because she was unable to eat. She was
22 unable to drink. She was admitted for dehydration,
23 and her mother called the gastroenterologist and said
24 she's here. They want to transfer her to your care
25 because you're a gastroenterologist. She was told

1 that's a general pediatric problem. Don't come.

2 Her mother was stunned. All she wants is to
3 provide care for her child, and they were not going to
4 provide even the most basic of care. Michelle stayed
5 in this hospital. She was treated for dehydration,
6 and while she was in the hospital her parents noticed
7 she didn't seem to be able to see.

8 You ask well, how do you determine whether a
9 child can see or not? Her parents would approach her
10 face and pretend that they're hitting her, and she
11 never reacted.

12 A consult was put in for an ophthalmologist,
13 and they said that she had uveitis, but it was an
14 adult ophthalmologist because unfortunately where
15 Theresa lives there is not a large pediatric practice
16 for any of the subspecialties. They recommended she
17 go and see a pediatric ophthalmologist. They
18 stabilized her condition.

19 During this hospitalization also they
20 noticed that her leg was swollen. The rheumatology
21 people were called in, but they were adult
22 rheumatologists. They were not pediatric
23 rheumatologists. There wasn't any pediatric
24 rheumatologists where they lived. They thought she
25 had juvenile rheumatoid arthritis. It was mentioned,

1 but they didn't know. They recommended that she go
2 and find a pediatric rheumatologist.

3 Meanwhile, Theresa continues to surf on the
4 net, and she finds that there is a GI doctor available
5 who has been treating people, and he was going to
6 appear at the next DAN! conference. True to form,
7 Theresa chased down Dr. Krigsman because she wanted
8 help for Michelle.

9 Dr. Krigsman agreed to consult with her and
10 while she was hospitalized was consulting with her
11 treating doctors about what to do with Michelle's
12 problems, her GI problems in particular. When
13 Michelle was well enough she did go to New York. She
14 traveled to New York with her family and Michelle and
15 had her evaluated by Dr. Krigsman.

16 You'll hear Dr. Krigsman. He'll come in and
17 testify on behalf of his client, his patient. You'll
18 hear that Dr. Krigsman has had probably the most
19 experience in treating the enterocolitis of autistic
20 children.

21 You'll hear that the histories that he
22 obtained from her, the clinical signs and
23 presentation, the appearance on endoscopy, the
24 pathological findings that he saw, the tests that he
25 ran, they were all entirely consistent with a child

1 who had a persistent viral infection in her gut.
2 Because they had previously obtained measles in her
3 gut back in 2002, he believed it was more probably
4 than not the measles that was causing the problem.

5 So Michelle went home. After this
6 hospitalization for dehydration, because she couldn't
7 eat or drink, they had to insert what's known as a PEG
8 tube. It's a feeding tube for nutrition. Dr.
9 Krigsman consulted on a long distance basis, but
10 because Michelle's care was so complicated her parents
11 decided that they needed somebody closer, and Dr.
12 Krigsman wholeheartedly agreed with that. They needed
13 somebody closer.

14 They went to San Diego Children's Hospital
15 from Arizona, a ride of three hours, to obtain care
16 for their child because she was their one child, their
17 only child, and they were going to try and do the very
18 best that they could for her. At San Diego Children's
19 they saw a pediatric rheumatologist, and he thought
20 that she had an arthritis that was related to her
21 bowel disease.

22 While there, she also saw a pediatric
23 ophthalmologist, and he thought that her eye problems
24 were related to her bowel disease and her arthritis.
25 At that pediatric ophthalmology exam she found out

1 that Michelle had lost 90 percent of the function of
2 her optic nerve. Michelle was almost blind.

3 He ordered treatment, and luckily that has
4 stabilized to a certain extent, and Michelle can once
5 again engage in the few activities that give her any
6 sort of pleasure such as watching her Sesame videos.

7 Now, you will hear evidence that mercury is
8 one of the most toxic substances in the world. It
9 doesn't matter whether it's methyl mercury, ethyl
10 mercury or mercuric mercury. It affects all bodily
11 tissue, including the immune system.

12 You'll hear evidence of how the world
13 discovered how toxic mercury was. The first mass
14 contamination case occurred in Minamata, Japan, where
15 the population there ate fish that consumed a
16 substance that was containing mercury. Their
17 children, the children who were exposed in utero, were
18 born with these incredible central nervous system
19 problems. Some died. Some didn't. Those who
20 survived didn't survive very well. So we have
21 Minamata.

22 And then the world also gave us the grain
23 contamination cases in Iraq where poor farmers were
24 given seed grain that was coated with a preservative,
25 whether it be methyl mercury or ethyl mercury, and not

1 knowing washed the seeds and made it into bread. They
2 ate that bread that was contaminated with the methyl
3 mercury or the ethyl mercury, and those people came
4 down with problems, central nervous system problems,
5 among other things, and their children who were
6 exposed came down with problems, and their children
7 who were exposed only through breast milk came down
8 with central nervous system problems. Among one of
9 the most toxic substances in the world.

10 Because of this, you will hear that the
11 federal government has funded two studies, the
12 Seychelles Islands and the Faroe Islands. The Faroe
13 Islands, somewhere up in the North Atlantic, looked at
14 people who ate pilot whale. The Seychelles, down
15 someplace warmer, had people who had a steady state of
16 fish for their diet.

17 The two studies were not consistent, so the
18 White House convened a panel to look at why are these
19 two studies not consistent, and the members of that
20 panel, a very august body of toxicologists who had a
21 great deal of experience with metal toxicity including
22 mercury toxicity, came to some conclusions and made
23 some recommendations, and when those recommendations
24 were followed, they found that the studies were
25 consistent with one another, that low-level mercury

1 exposure could cause neurological problems.

2 Shortly thereafter, a third study came out
3 from New Zealand, a small study that supported that
4 same premise, that low-level mercury can cause central
5 nervous system problems. Now, you may wonder, what is
6 the safe dose? Is there a safe dose? Well, EPA came
7 out with a safe dose: 0.1 microgram per kilogram of
8 body weight per day, over your lifetime. If you do
9 the math, you will find that Michelle Cedillo's
10 mercury level exceeded that from the day of birth.

11 You're thinking, well, why is that so
12 dangerous, probably. It's dangerous because it's a
13 baby, a baby who has an immature immune system, a baby
14 who has an immature neurological system. It's growing
15 still, it's developing, and the mercury can affect
16 both systems. And you may wonder, why not everybody,
17 because everybody received it, but not everybody came
18 down with these problems.

19 You'll hear evidence that the immunization
20 schedule is a schedule, is not administered at one set
21 date and time. There is a range of time in which it's
22 considered important. You'll hear also that
23 neurological and immunological development has a
24 schedule as well. There is also a range of time, and
25 before you can have harm, you must have that exposure

1 occurring at this vulnerable period of time in a
2 child's life, and the Petitioner submits that that is
3 what happened in Michelle Cedillo's case.

4 You will hear evidence from scientists that
5 the measles that was discovered in her gut has caused
6 her persistent GI problems, the persistent diarrhea,
7 the persistent constipation, and that, in conjunction
8 with the mercury, has affected her ability to clear
9 this measles from her body.

10 And what happens when you have persistent
11 measles virus? Is this something new? Is this
12 something that we don't know anything about? No. We
13 do know that people can develop persistent measles
14 infection that doesn't manifest itself immediately.
15 There is a long latency period, and we do know that
16 years after exposure, these people can come down with
17 neurological problems, and medicine knows that and
18 they acknowledge that it occurs.

19 So what about Michelle? Does her case
20 match? Well, you've got to remember that the time of
21 exposure will determine the type of harm that you
22 have. So in this situation, where you have persistent
23 measles that won't go away because the immune system
24 has been affected by thimerosal which was given
25 earlier. It allows the measles virus to enter the

1 neurons, and when it enters the neurons, it can affect
2 the function of the brain.

3 It doesn't necessarily affect the appearance
4 of the neurons, but it can affect the function of the
5 brain. Do we know that this happens? Well, there is
6 certainly evidence that it happens. There is a very
7 well-known researcher who has been looking at
8 persistent viral infections for a very long time, and
9 he firmly believes that it can happen.

10 You will hear evidence in this case that in
11 one of the doctors that Michelle's parents sought care
12 from, that the immune panel was performed, and they
13 looked at her immune system. You will hear evidence
14 that that doctor indicates that her immune system was
15 almost perfect. You will hear evidence that this
16 physician subsequently published an article that
17 indicates that autistic children that he saw had what
18 is known as a skewing of Th2.

19 In other words, the immune system was skewed
20 toward one particular element in the immune system,
21 and because it was skewed in that manner, it couldn't
22 clear infections, such as viruses. You will hear
23 evidence that wild measles can cause both GI problems,
24 gastrointestinal problems, as well as central nervous
25 system problems. That's well acknowledged.

1 It is acknowledged also that the vaccine
2 strain can do the same thing, albeit on a much reduced
3 level. You will hear evidence that Michelle has both
4 a GI problem and a central nervous system problem, and
5 you will hear that, more probably than not, Michelle's
6 current condition, her autism, her arthritis, her
7 uveitis, her persistent GI problems, are probably
8 related, and they are probably related to the fact
9 that her immune system has been affected by the
10 mercury that was contained in her vaccines and
11 prevented the measles virus from being eliminated from
12 her body.

13 This program that you are sitting here, and
14 that the special masters have run for a number of
15 years, was created by Congress as a social contract
16 between the public and potential people who have been
17 harmed by vaccines. Everybody knows that depending on
18 who you are, you will react to substances that other
19 people will not react to. That is not in dispute.

20 In exchange to protect the public health,
21 the government has asked that we immunize everybody,
22 that parents immunize their children. The Cedillos
23 accept that, and they did that. But in exchange for
24 this promise, Congress said that this program will
25 take care of your children when they get harmed. The

1 Cedillos are here to ask these three Special Masters
2 to honor the intent of Congress by taking care of
3 Michelle Cedillo for the rest of her life when her
4 parents are no longer able to do so. Thank you.

5 SPECIAL MASTER HASTINGS: Thank you, Ms.
6 Chin-Caplan. We will next hear from Respondent's
7 counsel. I understand that Respondent's counsel wants
8 to address some of the arguments made by the
9 Petitioners' counsel at this time and reserve the rest
10 of his opening for the beginning of the government's
11 case, which will be next week, but Mr. Matanoski,
12 please go ahead.

13 MR. MATANOSKI: Thank you, Your Honor.
14 First, I thank you for graciously letting me split my
15 opening to speak briefly about the overall program
16 issues that were raised, primarily by Mr. Powers, and
17 then to reserve my more case-specific comments to the
18 beginning of the government's case.

19 It's interesting, I know that the folks who
20 are listening in can't see this, but the podium that I
21 am standing before offers you a choice. You really
22 can either turn towards the Special Masters and
23 address them or turn towards the audience and address
24 the audience, and I noticed that the Petitioners'
25 counsel both addressed the audience rather than -- and

1 they had their backs to the Special Masters.

2 I would submit that this choice that you
3 have is to direct your comments, or at least face,
4 those who will be deciding the case, and that's not to
5 diminish the importance of those sitting in the crowd
6 here or listening in; it's that they are listening in,
7 they are not deciding this case, so my comments aren't
8 directed to you, though of course you are welcome to
9 listen to them. My comments are directed to the
10 bench.

11 First, I would like to address where Mr.
12 Powers started, and that is with the Vaccine Program.
13 Now, he pointed out that the Vaccine Program exists
14 in part to divert litigation from civil proceedings to
15 this court. Now, it's interesting, though, that at
16 that point he professes surprise that the federal
17 government, your federal government as he reminds you,
18 entered a case, a civil case, it was in Oregon, and
19 explained to the federal judge there the cases
20 involving vaccine injuries needed to be brought before
21 this court.

22 That case was proceeding under an attempt to
23 find a loophole in the very program that Mr. Powers is
24 here talking about today. Now, he also failed to
25 mention that the government's position was not only

1 vindicated there, but was vindicated by a special
2 master of this court. That special master, the Chief
3 Special Master, found that cases involving such
4 vaccine injuries needed to be brought in front of this
5 court.

6 Mr. Powers tried to present the government's
7 intervention in that federal case in Oregon as the
8 government standing "shoulder to shoulder" -- and he
9 used that term several times -- with vaccine
10 manufacturers. Well, I happen to be the government
11 attorney who appeared in Oregon, and I remember very
12 distinctly who I was standing shoulder to shoulder
13 with. I was sitting next to Mr. Powers and his
14 partner Mr. Williams in the table in front of this
15 federal judge in making my case.

16 And in fact, my case, in very pertinent
17 parts, stood in opposition to several points that the
18 vaccine manufacturers were making. I was very careful
19 to distinguish certain cases that need not be brought
20 in front of this court.

21 Mr. Powers also discussed the proceedings
22 before this court, the long history, and I'd like to
23 discuss that, hopefully briefly. He mentioned that
24 short-form cases were brought. That was at the
25 petitioners' or the PSC's insistence. He indicates

1 that those needed to be brought because there were
2 time periods that were so short, he didn't have time,
3 or the petitioners wouldn't have time to file their
4 records before they get their cases before the court.

5 Now, what he doesn't mention is, did they
6 not have time to actually make an allegation of what
7 injury it was? These short-form petitions provide no
8 information at all about what the theory is. In fact,
9 every single one of them provides at least three
10 different theories that the petitioners can proceed
11 under. These are place holding. What the Secretary
12 is forced to defend against is about 5,000 cases that
13 the Secretary knows nothing about, knows nothing more
14 in the majority of those cases than the names of the
15 petitioners.

16 What he also didn't mention is that if time
17 was of the essence and that's why short-form petitions
18 were necessary, that they needed to be filed because
19 there was not time to collect those records before the
20 statute of limitations would run, what's he been
21 doing, what's the Petitioners' Steering Committee been
22 doing in the last five years? Those cases have sat
23 for that time without any records being filed. If
24 time was of the essence, I'm sure that five years
25 would have been more than enough time to collect those

1 records and get them filed.

2 He has complained about the frustrations the
3 PSC has had in discovery. In fact, the PSC has
4 received more data from the government in these
5 proceedings than in all other vaccine cases combined
6 over the almost 20-year history of the program. He
7 has received over 218,000 pages of government
8 documents. He complains that the answers weren't in
9 there. Those were the documents he requested. Those
10 were the documents the PSC sought.

11 Now, it's true, they didn't seek everything
12 they were looking for, and he says he had to fight, or
13 the PSC had to fight, every step of the way to get
14 this information. They had to fight and file motions
15 to compel. All of that material that they were
16 provided by the federal government was provided
17 without them filing a motion to compel. Every single
18 motion to compel that they have filed for anything
19 that was not provided to them, they have lost.

20 I would submit to you that the federal
21 government's resistance in certain instances to their
22 broad requests was vindicated by your decisions in
23 this case. They deposed government officials from the
24 Centers for Disease Control, from the National
25 Institutes of Health, from the National Center for

1 Birth Defects and Developmental Disabilities, from the
2 Agency for Toxic Substances and Disease Registry, and
3 from the National Institute of Environmental Health
4 Sciences, and from the Food and Drug Administration.

5 They received all of this discovery in a
6 program that Congress said should not involve
7 extensive discovery. Now, listen closely to what you
8 hear in this case. You won't hear that discovery
9 being used in this case.

10 They indicated that most of the documentary
11 evidence that they received was in the form of PLAs,
12 Product License Applications. That's what they
13 requested. They indicated that those applications, or
14 that information, couldn't be given, wasn't given by
15 the federal government until the information had been
16 reviewed by the manufacturers that submitted it. What
17 he failed to mention was that federal law required
18 that.

19 What he failed to mention was that the
20 manufacturers stood ready to sue the Food and Drug
21 Administration if necessary if the Food and Drug
22 Administration were to reveal trade secret information
23 in the materials given to the Food and Drug
24 Administration.

25 He mentions also that during the course of

1 the litigation, manufacturers, as he put it,
2 intervened in these proceedings. Actually, I think
3 you will recall that what happened was the PSC sought
4 subpoenas against the manufacturers, and that in
5 discovery in this program, it is discovery for your
6 purposes. You have to, Special Masters, determine
7 that you need the information, and it was at your
8 invitation that the manufacturers were invited before
9 the Court to provide their views so that you could
10 decide whether you needed that information or not.

11 And what he failed to mention was that you
12 decided that you did not need that information. What
13 he also failed to mention is that the federal
14 government did not oppose those subpoenas. That is
15 because the federal government did not have a
16 position, did not have a stake in that fight.

17 There has been some talk about the
18 government's efforts to receive certain information
19 that had been filed in litigation in the United
20 Kingdom. This has been characterized as cherry
21 picking on behalf of the government, that they chose
22 only certain information that had been filed in that
23 proceeding and presented it before you. In fact, the
24 reports received, obtained by our efforts, in essence
25 have balanced the scales.

1 The Petitioners here actually cherry-picked
2 a few experts that had presented evidence in the
3 United Kingdom litigation and presented them before
4 you. You'll now have before you both. You'll have
5 those experts and you'll also have the views of other
6 experts who actually had the ability to take a look at
7 the Unigenetics lab, at Dr. O'Leary's lab, to take a
8 look at the information, the lab reports, the
9 equipment, the lab layout, and determine whether or
10 not measles virus could be reliably detected by their
11 methods. I think you will find it interesting, as we
12 did, once you review that information, that the
13 Petitioners' experts fail to mention any of this in
14 their reports.

15 Petitioners mention that it took five years
16 to get to this point. They indicate that that was
17 because the science was developing, that they needed
18 that time to develop their cases. In fact, when you
19 hear the evidence that will unfold in the next two to
20 three weeks, you will find that nothing that you hear
21 here could not have been presented when this file was
22 originally scheduled to be heard in 2004. There is no
23 new theory here. There is no new evidence that was
24 developed in the course of the five-year wait that we
25 have had to get to this point.

1 I want to depart just for a moment to talk a
2 little bit about the notion that the government will
3 move to dismiss untimely cases. Well, yes, the
4 government will dismiss untimely cases, move to
5 dismiss it. Untimely cases are cases that are barred
6 by statute from being before you. They are not
7 legally supposed to be here. That's why we'd move to
8 dismiss, and if you agreed, that's why you would be
9 compelled to dismiss that.

10 I listened very carefully to the PSC
11 arguments regarding the fairness of these proceedings.
12 The ill motives of the government, the purposes of
13 the Vaccine Program from the PSC's view, the dangers
14 of vaccines. What I didn't hear this morning in
15 comments was how this case is a causation-in-fact
16 case, and how vitally important in a causation-in-fact
17 case it is that the result be determined by the
18 dictates of good science.

19 Now, good science has been given definition
20 and meaning by the Supreme Court of the United States.
21 Petitioners' argument that the requirements of good
22 science shouldn't find place here flies in the face of
23 that Supreme Court precedent. They have argued that
24 in their papers. Good science does apply. It has to
25 apply here. What has no place here or in any federal

1 court is junk science.

2 What has no place here are experts at the
3 margins of legitimate science who present untested
4 theories, untested hypothesis, speculation,
5 conjecture, logical fallacies based on post hoc ergo
6 propter hoc reasoning. Nothing in the congressional
7 history of this act suggests that the court is to
8 accept bad science.

9 The PSC reminds you that the standard here
10 is preponderance of the evidence. That's true. It's
11 also not news. That's been the standard since the
12 Vaccine Act began. So for almost 20 years we've been
13 operating under that standard. In fact, that's the
14 standard in all civil proceeding in this country. It
15 is the standard in Daubert.

16 What is critically important, though, is
17 what kind of evidence goes into meeting that standard.
18 What is critically important is that that evidence be
19 reliable, that it be good science in this instance,
20 because we are going to be essentially addressing a
21 scientific question here. What you need to consider
22 in judging this is whether that science that they are
23 presenting to you meets that standard. Does it meet
24 the dictates of Daubert as reliable science?

25 You need tested hypotheses, you need good,

1 legitimate lab results, you need testimony that can
2 withstand critical examination. You need thorough
3 study. That's what forms the bedrock of good science.
4 Unfortunately, after five years to prepare their
5 case, the PSC will not present that to you. Search as
6 you may, you will find no support for key links in
7 their theoretical chain of causation.

8 You will find that their witnesses presented
9 views that find no place in reliable science. You
10 will find a signal lack of support for their
11 contentions. You will find that their hypotheses are
12 untested, or when tested, they have been shown to be
13 false. You will even find the support they site for
14 critical aspects of their site has been discredited.

15 Their experts and their expert testimony
16 will be discredited here because their opinions are
17 nothing more than that; they are opinions, they were
18 developed for litigation, they are unsupported, and
19 they are held by these experts alone. They are not
20 science. Thank you.

21 SPECIAL MASTER HASTINGS: Thank you, Mr.
22 Matanoski.

23 Ms. Chin-Caplan, should we start with the
24 testimony of Dr. Aposhian, then?

25 MS. CHIN-CAPLAN: Yes.

1 SPECIAL MASTER HASTINGS: All right. Dr.
2 Aposhian, if you could take the witness stand here.
3 And I think Ms. Chin-Caplan will perhaps go roughly a
4 half an hour into Dr. Aposhian's testimony and then we
5 will take our morning break. So go ahead. Actually,
6 let's --

7 Whereupon,

8 H. VASKEN APOSHIAN

9 having been duly sworn, was called as a
10 witness and was examined and testified as follows:

11 SPECIAL MASTER HASTINGS: Okay. Please go
12 ahead, Ms. Chin-Caplan.

13 MS. CHIN-CAPLAN: Thank you, Special Master.

14 DIRECT EXAMINATION

15 BY MS. CHIN-CAPLAN:

16 Q Dr. Aposhian, would you kindly state your
17 name for the record, please?

18 A I'm sorry?

19 Q Could you kindly state your name for the
20 record, please?

21 A All right, my name is H. Vasken Aposhian.

22 Q Dr. Aposhian, what is your current business
23 address?

24 A Department of Molecular and Cellular
25 Biology, Life Science South Building, University of

1 Arizona, Tucson, Arizona, 85721.

2 Q What is your current position?

3 A I am Professor of Molecular and Cellular
4 Biology at the University of Arizona, and I am also
5 Professor of Pharmacology in the medical school at the
6 University of Arizona.

7 Q Could you kindly give a description of your
8 educational background from undergraduate, please?

9 A I received my undergraduate degree, Bachelor
10 of Science, in chemistry, at Brown University, 1948.
11 I received a master's degree and a PhD in
12 physiological chemistry at the University of
13 Rochester. I did a postdoctoral with a Nobel Laureate
14 in the department of biochemistry at Stanford
15 University School of Medicine. I have done sabbatical
16 scholar-in-residence at MIT and at the University of
17 California at San Diego.

18 Q Doctor, are you a toxicologist?

19 A People call me other things, but they also
20 call me an environmental toxicologist.

21 Q And what is an environmental toxicologist?

22 A Environmental toxicologists are interested
23 in understanding how chemicals in the environment will
24 affect the health of human beings.

25 Q And Doctor, as part of your position as an

1 environmental toxicologist, have you consulted to
2 other countries or other governmental bodies on --

3 A Yes.

4 Q -- mercury?

5 A I've been a consultant to our government on
6 a variety of National Institutes of Health committees,
7 Food and Drug Administration committees, the
8 Environmental Protection Agency commission,
9 Administration committees, I think the Atomic Energy -
10 - the old Atomic Energy Commission. In foreign
11 countries, I was consultant to the governments of
12 China, the autonomous region of Inner Mongolia,
13 Romania, Chile, and Mexico.

14 Q And when you consulted to these agencies and
15 foreign governments, was your consultation related to
16 mercury?

17 A The studies in Mexico concentrated on
18 mercury. The studies in Inner Mongolia, southwest
19 China, Romania and Chile emphasized the exposure of
20 the population to arsenic in their drinking water.

21 Q Now, the substances that you consulted on,
22 are they considered to be heavy metals?

23 A Yes. That is what I deal with in the
24 laboratory, what I deal with a great deal in my
25 teaching, and what I deal with a great deal in the

1 writing that I do.

2 Q So have you conducted research on heavy
3 metals?

4 A Oh, yes, since 1955.

5 Q And have you conducted research on mercury?

6 A We, in 1957, published the first study which
7 showed that in experimental animals, a new drug that
8 we developed and others helped develop would prevent
9 the lethal effects of mercuric chloride.

10 Q And Doctor, forgive me, but have you
11 published articles on the effects of mercury?

12 A Yes, many. I can't give you the number.
13 There are many.

14 Q And do some of those publications involve
15 the effects of mercury on the health of individuals?

16 A Yes.

17 Q And you indicated that you teach. Who do
18 you teach?

19 A I am very fortunate to teach a small class
20 of about 15 or 20 students. These are seniors who are
21 going on to graduate school, medical school, or
22 professional schools like law school. These are very
23 carefully chosen students that we think are going to
24 be the future leaders of the community. And I teach
25 these students how the biology that they have been

1 taught prior to my seeing them is relevant to their
2 everyday life, to their exposure to metals, to
3 mercury, to arsenic, to lead, their exposure to PCBs
4 and other toxic substances.

5 Q Now, Doctor, you mention that you consult to
6 governmental agencies. Are you familiar with a group
7 that was convened by the White House to study the
8 situation of mercury in emissions?

9 A The -- ?

10 Q To study mercury.

11 A I'm sorry, I didn't understand that.

12 Q Are you familiar with a conference that was
13 convened by the White House to study mercury?

14 A Yes, yes, I was a member of that conference.
15 I was a member of that panel.

16 Q And, Doctor, the other members of the panel,
17 did they also possess expertise in mercury?

18 A Many of them had such an expertise.

19 Q Doctor, can you describe to the Court what
20 the purpose of this panel was?

21 A A number of us were very concerned that
22 three agencies of the federal government could not
23 agree on an RfD, that is the safe dose, the dose that
24 if you are exposed to each day for the rest of your
25 life of mercury, there would be no harm done to you.

1 We were concerned that the three agencies of the
2 federal government could not agree on this.

3 We were also concerned that the government,
4 through the National Institute of Environmental
5 Sciences, had put millions of dollars, not just a
6 million, but millions of dollars into two studies; one
7 up in the Seychelles Islands -- one down in the
8 Seychelles Islands, and one up in the Faroe Islands,
9 as far as the influence on the intelligence of
10 children if their mothers ate a lot of fish that
11 contain methyl mercury.

12 These two studies, at the time of the White
13 House conference, were diametrically opposed as to the
14 results, and we felt, a number of us felt that a
15 conference should be held to try to resolve these
16 issues and try to advise the three government agencies
17 that it was rather bizarre that three agencies of the
18 federal government could not look at data and come to
19 the same conclusion.

20 Q Doctor, could you generally describe to this
21 Court what the conclusions of that panel was?

22 A The conclusions were, and the
23 recommendations were, that the University of Rochester
24 investigators who were the primary investigators of
25 the Seychelles Islands study, and the Faroe Island

1 group that was the University of Odense in Denmark
2 were the primary investigating group, that they should
3 get together and use the same kinds of tests that
4 could solve this mystery.

5 And one of the problems, the major problem
6 was that the Faroe Islands study showed that children
7 borne of mothers exposed to methyl mercury in the fish
8 and seafood they ate had certain definite learning
9 disorders. Clearly shown. They used what we called
10 the domain study. The Seychelles Islands study said
11 there were no effects. And, again, each group used
12 different tests to test the intelligence of the
13 children.

14 We strongly recommended that both groups
15 used the same tests. In addition, the Seychelles
16 Islands study examined children at age 5. The Faroe
17 Islands study examined children at age 7. We
18 recommended, since there were results indicating
19 harmful effects on the intelligence of the child at 7
20 years of age, that the Seychelles Islands study should
21 be done at 7 years of age also.

22 And this was done subsequently, and so now
23 we know that there are also results now in the
24 Seychelles Islands indicating that boys in the
25 Seychelles Islands population had certain intelligence

1 deficits at age 7 that did not show up at age 5.

2 We also recommended that the three
3 government organizations, the FDA, the EPA and the
4 toxicology group of the NIHS, should get together and
5 try to solve their problems and communicate better.
6 The result of this was the FDA, about two years ago,
7 came out with the statement they agreed with the EPA
8 that the RfD should be 0.1 micrograms of mercury per
9 kilogram per day.

10 The other group, the -- can I look at my
11 notes? I can never remember their name. I seem to
12 have a block. The Agency for Toxic Substances and
13 Disease Registry, the ATSDR, they still have not
14 changed. And they haven't changed because they are
15 using the old Seychelles Islands data, not the new
16 data that is now published.

17 Q Doctor, have you prepared an outline to
18 assist the Court in evaluating the toxicity of
19 mercury?

20 A Yes. May I go through it?

21 Q Certainly.

22 A All right. First I'd like to talk about the
23 forms of mercury, the target organ and the sources.
24 Then I'd like to consider the methyl mercury
25 disastrous epidemiology studies, the estimated daily

1 intake and retention of mercury for the general
2 population. Pink disease, which is due to a form of
3 mercury, is a perfect example of the medical
4 establishment being conservative and wrong, and we
5 will present evidence for that.

6 Very important studies now show that changes
7 in the human gene that modifies the effect of mercury
8 on a biological process. I want to point out there is
9 now considerable evidence that autism is a mercury
10 efflux disorder. I want to review ethyl mercury and
11 methyl mercury for the Court. I would like to discuss
12 Michelle Cedillo as far as her cumulative mercury
13 exposure is concerned, and I would like to summarize.

14 Q Thank you, Doctor. So, would you kindly
15 describe to the Court the forms of mercury?

16 A The purpose of my making this slide was to
17 acquaint and/or review for the Court the diversity and
18 toxicological properties of various chemical forms or
19 species of mercury. Next, please. First of all, we
20 have elemental mercury. Most of you are familiar with
21 liquid silver, as it was called. Children used to
22 play with this.

23 Elemental mercury in its liquid form is
24 relatively nontoxic, but at room temperature, it emits
25 a vapor, and that vapor is very, very toxic. Next

1 slide, please. Organic mercury. Here we have enigma
2 number one. In the case of organic mercury, I could
3 be exposed today to a very strong dose, a very toxic
4 dose of an organic mercury compound, and no
5 manifestation of that toxicity, no sign or symptom,
6 might appear, would not appear until four or five
7 months. And we'll talk more about that in a moment.

8 An example of organic mercury is methyl
9 mercury found in fish. Another example is thimerosal,
10 and a second enigma is why it was ever included in
11 vaccines to begin with. We'll talk about that.

12 We have dimethyl mercury, which is extremely
13 toxic, so toxic it's called the super toxic form of
14 mercury. Most toxicologists don't like the term super
15 toxic, but it is extremely toxic.

16 What happened was that a very talented young
17 woman, a professor of chemistry at Dartmouth College,
18 about maybe five or six years ago -- actually it was
19 10 years ago -- was working under the hood with
20 dimethyl mercury, which all of us have used to
21 calibrate a certain specialized scientific instrument.

22 While she was working under the hood she
23 dropped one or two drops, according to her notebook,
24 of dimethyl mercury on her latex glove. She took the
25 glove off and disposed of it.

1 My wife and I were at a conference with her
2 in Kuala Lumpur, Malaysia, approximately five months
3 later. We were having dinner, and she said you know,
4 I'm not sure I'm -- in fact, I'm not feeling well. I
5 don't know whether I'm getting the flu or not. I've
6 never had the flu, but I just don't feel well.

7 That was in December 1997, I think. She
8 went home, and she was hospitalized in February. The
9 sign and symptoms occurred five to six months later
10 from the time she was exposed or dropped the mercury
11 on her glove. This wonderful woman died of severe
12 mercury poisoning I think it was in February of that
13 year.

14 This is an example of the most toxic form of
15 mercury, and it's an example of what we didn't know at
16 the time. It was sent through the mail. We could
17 order it any time we wanted. We let students work
18 with it. It wasn't until this happened that now there
19 are very rigid federal regulations as to how dimethyl
20 mercury should be handled.

21 Q Doctor, what you have described, are they
22 considered to be organic forms of mercury?

23 A Yes.

24 Q Does organic become inorganic?

25 A Yes. Almost all these forms of mercury,

1 organic mercury, are oxidized to what we call mercuric
2 mercury.

3 Mercuric mercury has a very high affinity
4 for the self-hydro groups of enzymes, for the active
5 senses of enzymes. Mercuric mercury is a standard
6 enzyme inhibitor used in the laboratory and can be
7 used in vivo also to do this.

8 Q And that's considered a form of inorganic
9 mercury?

10 A Yes. Mercuric mercury is a form of
11 inorganic mercury.

12 Q And what is the relationship between the
13 organic mercury and the inorganic mercury?

14 A The organic mercury in the human body, every
15 one of them is converted or metabolized to some extent
16 to mercuric mercury.

17 Q And is there another form of inorganic
18 mercury?

19 A Can I have the next slide, please? We have
20 mercurous mercury. This is Enigma No. 4, and that is
21 why certain children were so hypersusceptible to
22 mercurous mercury.

23 They got pink's disease, and we'll talk more
24 about pink disease later, but this is a disease in
25 which one out of every 500 children that were exposed

1 to this teething powder that contained mercurous
2 mercury, one out of 500 of them got pink's disease.

3 Q Doctor, what are the target organs for
4 mercury?

5 A The target organs, first of all, for mercury
6 vapor, the brain; methyl mercury, the brain;
7 thimerosal, the brain and the kidney; mercuric
8 mercury, the kidney. The immune system is also
9 affected by all of these.

10 Q Doctor, could you kindly describe to the
11 Court where this mercury comes from?

12 A Can I have the next slide, please? Let's
13 look at the sources of brain mercury as to where they
14 come from.

15 We have mercury vapor from the restoration
16 of a cavity in your tooth or teeth. You have a dental
17 amalgam, as we call it. That dental amalgam
18 continuously emits mercury vapor. Even in those of
19 you who have mercury fillings in your mouth, those
20 mercury fillings are continuously emitting mercury
21 vapor, which gets into the mouth, gets to the cavity
22 and finally finds its way to the lungs.

23 It's absorbed very quickly into the lungs,
24 transported very quickly to the blood-brain barrier
25 and to other tissues, but it's able to cross the

1 blood-brain barrier, which the blood-brain barrier is
2 to protect the brain from noxious substances.

3 The mercury vapor is lipid soluble so it can
4 diffuse right across. Once it gets into the brain the
5 mercury vapor is oxidized to mercuric mercury. Once
6 that mercuric mercury is formed it attaches to
7 proteins and, in my opinion, stays there forever.
8 There is much evidence in the literature that shows
9 that it can remain there for 25, 30 years.

10 One other form of mercury, the methyl
11 mercury, comes from fish. My students think this is a
12 whale, but it's supposed to be a fish. The methyl
13 mercury combines. First of all, when you ingest fish,
14 the methyl mercury in the fish, 95 to 99 percent of it
15 is completely taken up by the GI tract. It's
16 transported into the blood.

17 The methyl mercury, as soon as it hits the
18 blood, the methyl mercury cysteine complex is formed.
19 That methyl mercury cysteine complex locks to a
20 transport system, a system that carries the amino acid
21 methionine from the blood into the brain across the
22 blood-brain barrier, methionine being a central amino
23 acid.

24 That transport system cannot tell the
25 difference between cysteinyl methyl mercury and

1 methionine, so it's transported into the cell as
2 methyl mercury. There it's slowly demethylated to
3 form mercuric mercury, which again stays there.

4 Then finally we have thimerosal from
5 vaccine, which as soon as it enters the body is very
6 quickly metabolized to ethyl mercury. That ethyl
7 mercury we don't know the mechanism, but we know from
8 experiments that have been done that the ethyl mercury
9 gets into the cell, gets across the blood-brain
10 barrier, gets into the brain, and we know that the
11 ethyl mercury is deethylated to form mercuric mercury.

12 So from all these different forms of mercury
13 that a human being is exposed to you're going to have
14 this mercuric mercury remaining in the brain doing
15 some damage, as well as the parent compound like the
16 methyl mercury, the ethyl mercury, the mercury vapor,
17 doing some damage also.

18 Q So, Doctor, the mercuric mercury cannot
19 leave the brain?

20 A From all the studies that have been
21 published we have, methyl mercury -- well, the best
22 example I can give you was that in Mexico there was a
23 bottle of methyl mercury fungicide in the barn and a
24 hog tipped it over and drank it.

25 The family didn't know this. The next day

1 they killed the hog for food. They threw some of it
2 away. There were three young children in the family
3 that ate this meat. Two of them become very, very
4 ill. One died. Another one survived for about 20
5 years.

6 At the time of her death she was autopsied,
7 and at that time, 20 years after the exposure to
8 methyl mercury, her mercuric mercury level in the
9 brain was 100 times above normal.

10 Q Now, Doctor, have there been some studies
11 done on the effects of mercury on a person's health?

12 A On?

13 Q On a person's health.

14 A On children's health.

15 Q But have there been studies done by people
16 exposed to things such as dental amalgam?

17 A Yes. May I have the next slide, please?

18 The health effects of dental amalgam mercury now are
19 getting more and more well documented, papers
20 published in peer reviewed journals, and summaries
21 show that monkeys that had amalgams put into their
22 teeth and then later were exposed for a time to the
23 mercury emitted from these amalgams, that the bacteria
24 in their GI tract had increased resistance to
25 antibiotics.

1 This is now accepted by most of the people
2 that I know that amalgam mercury exposure will cause
3 resistance, an increased resistance to antibiotics.

4 There is a study done that actually you can
5 get a videotape of what's happening. In vitro, the
6 mercury from dental amalgams will destroy snail brain
7 neurons. They weren't able to get human neurons from
8 the brain for obvious reasons, so they used snail
9 neurons because snail neurons are big and you can look
10 at them.

11 In this video you can see the actual
12 disintegration of a neuron after exposure to amounts
13 of elemental mercury equivalent to what would be
14 emitted from the amalgams in our teeth.

15 It's generally agreed that there is a
16 hypersensitivity problem as far as dental amalgams in
17 humans are concerned. There's not agreement as to
18 what percentage. One figure is 0.5 percent of the
19 human population is hypersensitive. Another figure is
20 15 percent. There just is not any agreement.

21 As far as the innate toxicity in humans,
22 there are studies for it and studies against it, and
23 we still have a lot more work to be done along these
24 lines. The problem is that most of the signs and
25 symptoms of mercury toxicity, actually what we call

1 micromercurialism, are very nonspecific. You can't
2 say they're just due to the mercury itself, so a lot
3 more has to be done than that.

4 There certainly is, and I hope to present
5 the evidence for this or present the reference for it,
6 now a hypersusceptibility of a certain percentage of
7 the population to amalgam mercury.

8 Q Doctor, does mercury ever disappear?

9 A No. Mercury is an element. You can't
10 destroy an element.

11 Q Doctor, when you look at this next slide,
12 does that indicate to the Court what happens to
13 mercury?

14 A Yes. This more or less shows you where the
15 methyl mercury in fish comes from. You have elemental
16 mercury vapor in the air. This elemental mercury
17 vapor is always being emitted from the ground. It's
18 being emitted from the ocean, and it's being emitted
19 from electric utility plants that produce electricity
20 by burning fossil fuel oil and coal.

21 So in the air you have elemental mercury.
22 This soon settles down by rain and other means into
23 the water or the lakes, oceans, et cetera, and the
24 elemental mercury, the Hg^0 , is oxidized to mercuric
25 mercury.

1 The mercuric mercury, as you see down in the
2 sediment, gets down in the sediment also, and that
3 mercuric mercury is oxidized to mercuric mercury, and
4 then there are certain bacteria found in the sediments
5 of oceans and other places that will methylate
6 mercuric mercury to form methyl mercury.

7 Unicellular organisms will eat a little bit,
8 will constantly pull this into them from the sediment
9 and from the ocean where it's also moved into, and it
10 goes through a process we call biomagnification; that
11 a unicellular organism has a little more, four or five
12 cell organisms will have more and finally a small fish
13 will concentrate more, so by the time it gets to the
14 predator fish there is a tremendous increase in the
15 concentration of methyl mercury in the predator fish
16 as compared to what was originally in the water.

17 Q Doctor, have there been studies done about
18 the health effects of exposure to mercury?

19 SPECIAL MASTER HASTINGS: Ms. Chin-Caplan,
20 before we go on to that I think now would be a good
21 time. Let's take our morning break. We'll take a 15
22 minute break.

23 I ask one particular thing. We have limited
24 restroom capacity on this floor. Folks, if you could
25 if you see one of the counsel or witnesses fighting

1 you for the next stall, please let them go first so we
2 can get back and finish up.

3 We'll take a 15 minute break. You folks at
4 home, you might get some music, but we'll take a 15
5 minute break, and we will be back on then.

6 THE WITNESS: Thank you.

7 (Whereupon, a short recess was taken.)

8 SPECIAL MASTER HASTINGS: All right. We're
9 ready to begin again for those of you listening in.

10 I wanted to remind both counsel and the
11 witness, especially for those folks at home, we need
12 you to speak into the microphone as best you can so
13 the folks listening in at home can hear, as well as
14 those here in the courtroom.

15 With that, we are back on the record. Ms.
16 Chin-Caplan, you can go on with the examination of Dr.
17 Aposhian.

18 BY MS. CHIN-CAPLAN:

19 Q Doctor, before we broke I asked you if there
20 are studies which have looked at the effects of
21 mercury on health.

22 A Right. In this slide we point out the
23 methyl mercury disasters in our epidemiology studies.

24 The next slide please? In Minamata, Japan,
25 in the 1950s what was first noticed was the cats would

1 do a dance on the seashore. They would chase their
2 tails. They traced this back to their eating fish.
3 Then they began to find birds dead on the shore, again
4 birds that had been eating fish autopsy showed.

5 About two years later it was found there was
6 a factory that was dumping mercury waste into Minamata
7 River. That river would empty into the Minamata Bay.
8 Because of the geology involved, the bay did not
9 empty completely when the tides changed, so the
10 mercury buildup settled into the sediment where it was
11 converted to methyl mercury.

12 The people living around Minamata Bay were
13 primarily fishermen. Fish were their primary source
14 of protein, and it was soon found that the people
15 eating the fish had certain neurological signs,
16 including movement disorders and that, more
17 importantly, the children born of women who had eaten
18 this contaminated fish, although the mothers did not
19 appear to have any signs of mercury toxicity the
20 children had severe mercury toxicity characterized by
21 some as what we call Minamata cerebral palsy.

22 There were other central nervous system/
23 brain effects noted in these children, so this was the
24 first methyl mercury disaster, you might say.

25 In Iraq in 1970 there was a famine. Because

1 our government looks after people all over the world,
2 because there was a famine our government donated to
3 Iraq bags of grain seeds so the farmers could take
4 these seeds and plant them, get the grain and make
5 flour, make bread, et cetera, et cetera.

6 The people were so hungry that they took the
7 seed, which is always protected by a fungicide, a
8 methyl mercury fungicide so the seeds' biological
9 activity is not inactivated by a fungus infection. On
10 the bags, I think 110 pounds bags of grain or seed
11 that was sent, it said Poison, Do Not Eat in either
12 English or in some cases in Spanish.

13 What the people in our government did not
14 realize was that most Iraqi farmers are illiterate in
15 Arabic, as well as of course being illiterate in
16 English, so they took this contaminated seed and
17 ground it up, made flour, made bread, and there were
18 6,000 cases in Iraq of methyl mercury poisoning.

19 This was one of the two studies that our
20 government depended on, the Minamata and Iraq study,
21 that made our health officials concerned about whether
22 low levels of methyl mercury in fish that our children
23 in this country are exposed to might be harmful to
24 them.

25 Next slide, please? Therefore, the

1 Seychelles Islands study and the Faroe Islands study
2 was set up, and I spoke to you about them already.
3 The enigma was why are they so different? We now know
4 there are a number of reasons that I'll speak to in a
5 few minutes as to why they're different.

6 Originally before the White House Conference
7 the Seychelles Islands study and the Faroe Islands
8 study did not agree at all. However, a study done in
9 New Zealand agreed with the Faroe Islands results, and
10 this was very important for our EPA to switch from
11 using the Iraqi data and the Minamata data to the
12 Faroe Islands data as far as establishing an RfD.

13 Q Doctor, what is an RfD again?

14 A The RfD is the amount of mercury in this
15 case, the micrograms of mercury per kilogram of body
16 weight per day that you can be exposed to the rest of
17 your life, every day of the rest of your life, with no
18 harmful effects.

19 Q And is that a steady state of exposure?

20 A The RfD would indicate what a steady state
21 exposure would be, but none of us are exposed, none of
22 us have a steady state exposure, to methyl mercury
23 when we eat fish, for example.

24 Q Doctor, what is the reference dose?

25 A The EPA reference dose is 0.1 micrograms of

1 mercury per kilogram per day.

2 Q Doctor, did you compare that to the dosages
3 of mercury that Michelle Cedillo received in her
4 vaccines?

5 A On her first vaccine dose when she was I
6 believe one day old, the Cedillo child received 12.5
7 micrograms of mercury.

8 She had a body weight of approximately 3.6
9 kilograms, and that meant that her exposure was 3.5
10 micrograms of mercury per kilogram per day, which is
11 35 times the EPA RfD, or you might say the EPA safe
12 dose. So this is quite high, and you'll see later on
13 there are even higher doses that we'll point out.

14 What was very interesting to all of us -- I
15 first heard about it on an airplane when I was going
16 to a meeting with someone from Montreal. This young
17 woman in Montreal is a professor of epidemiology
18 studying people in the Amazon who were eating fish
19 that were contaminated with methyl mercury.

20 She had two groups. One group had no signs
21 of methyl mercury exposure. The other group had
22 severe signs. She traced this back that the group
23 with no signs had eaten a lot of oranges and citrus.
24 We think this again may be one of the reasons why the
25 Seychelles Islands study could not come up with these

1 effects that the Faroe Islands did.

2 I think the world map may be shown in the
3 next slide. The Faroe Islands is roughly I think
4 right there. The Seychelles Islands are roughly
5 around here. Right there. This is a tropical or
6 subtropical area where there's a lot of citrus grown,
7 a lot of oranges.

8 Q Doctor?

9 A Those of us who have been to the Faroe
10 Islands, there are hardly any trees, never mind citrus
11 trees. The people had to cut the trees down -- it's
12 so cold up there -- for fuel years ago, and to buy an
13 orange? I wanted an orange one day when I was there
14 for a week. I couldn't even find an orange for sale.

15 One reason for the Seychelles Islands study
16 not showing the effects that the Faroe Islands study
17 did was the Faroe Islands subjects did not have the
18 protection of citrus.

19 Q Doctor, are children more susceptible than
20 adults to the effects of mercury toxicity?

21 A Will you say that again, please?

22 Q Are children more susceptible to the effects
23 of --

24 A Yes. May I have the next slide? I think
25 it's on the next slide. First of all, let me just

1 point out -- that's all right. That's okay.

2 Let me first point out that everyone is
3 exposed to mercury, and this is from the National
4 Research Council monograph that I was involved in the
5 writing of shows the estimated daily intake and
6 retention of micrograms per day of mercury in the
7 general population not occupation exposed to mercury.

8 The numbers in parentheses is what is
9 retained in the body. The numbers outside the
10 parentheses is the exposure. You can see that the
11 greatest exposure to the American population to
12 mercury is via dental amalgams.

13 Inorganic mercury is inconsequential,
14 especially if very little is retained, 0.3, but of
15 methyl mercury almost all of the exposure to methyl
16 mercury is retained. The methyl mercury stays in the
17 body.

18 The next slide I think will say something.
19 Children are not small adults. Very often people just
20 think they're smaller. We know their metabolism is
21 different. We know that they absorb metals from their
22 guts at a faster rate than an adult. The central
23 nervous system, the brain of embryos and children, are
24 the most sensitive to methyl mercury. That's been
25 clearly shown in animal studies and in human studies.

1 Methyl mercury crosses the placenta. The
2 placenta does not protect the baby or the embryo
3 against methyl mercury, and methyl mercury and ethyl
4 mercury have some similar properties, but their
5 toxicokinetics are different. The rate of change in
6 the body, the so-called toxicokinetics, are different
7 for the two.

8 Q Doctor, moving from methyl mercury to ethyl
9 mercury --

10 A Can I have the next slide, please? Okay.
11 The enigma for many years has been why is thimerosal
12 in vaccines, and this was brought up in a
13 congressional hearing that was held a number of years
14 ago. It must be four or five years ago.

15 The next slide, please? Since that time,
16 the FDA has pointed out in the *Federal Register* of
17 1982. It states, "The panel concludes that thimerosal
18 is not safe for over-the-counter topical use," for
19 drugs sold over-the-counter for topical use, "because
20 of its potential for cell damage if applied to broken
21 skin and its allergy potential."

22 It is not effective as a topical
23 antimicrobial because its bacteriostatic action can be
24 reversed. Its bacteriostatic action can be reversed
25 wherever it is. That's 1982.

1 Effective October 11, 2005, and these are
2 not my words. This is a direct quote from the *Federal*
3 *Register*. The October 11, 2005, *Federal Register*
4 stated:

5 "Effective April 1, 2007," a few months ago,
6 "a number of active ingredients have been present in
7 over-the-counter drug products for various uses as
8 ascribed below. However, based on evidence currently
9 available, there are inadequate data to establish
10 general recognition of the safety and effectiveness of
11 these ingredients for the specified use."

12 Thimerosal is quoted as one of these
13 ingredients.

14 Q Doctor, what was the effect of this ruling
15 in the Code of Federal Regulations?

16 A The net effect has been it has prevented and
17 stopped the addition of thimerosal to a tremendous
18 number of health products, including vaccines.

19 About the only vaccine that still has or the
20 only vaccine that children are exposed to that still
21 has thimerosal in it is probably influenza, although
22 one can obtain now influenza vaccine free of
23 thimerosal.

24 Q And that's to your knowledge currently?
25 That's to your knowledge?

1 A Yes.

2 Q Doctor, you had mentioned earlier about
3 pinks disease.

4 A Yes.

5 Q What is pinks disease?

6 A Okay. Between approximately 1890 and 1950,
7 a disease called acrodynia -- it has other names that
8 are here also; next slide, please -- was found in
9 young children, very young children.

10 I put this first because I want you to
11 remember this, please. The medical establishment did
12 not accept mercurous mercury as the cause, and we'll
13 say this again.

14 The next slide, please? Children with pink
15 disease were miserable babies and toddlers. They were
16 bright pink or red in color. They were photophobic
17 with raw beef hands and feet. They had anorexia,
18 peeling skin and gangrene. In other words, the blood
19 could not get to the extremities.

20 Next slide, please? The mortality of
21 children who got pink disease was 5.5 to 33 percent, a
22 very high mortality.

23 Now, at the time viruses were beginning to
24 become known. Research was showing that some diseases
25 were caused by viruses, and also at the same time

1 vitamins were the scientific rage.

2 They were discovering new trace elements and
3 vitamins that were required for good nutrition, so it
4 was fashionable, and those are the words the medical
5 literature historians use. It was fashionable at the
6 time to call it a viral disease or a nutritional
7 deficiency.

8 The next slide, please? It was found that
9 mercurous mercury in teeth powder was the cause. What
10 you want to remember also is that of 500 children
11 exposed only to this teeth powder that contained
12 mercurous mercury, only one would develop acrodynia.
13 Only one would get pink disease, one out of 500.

14 So one must ask were these children
15 hypersusceptible to the effects of mercury? The next
16 slide, please?

17 Q Doctor, when you say hypersusceptible, are
18 you referring to the fact that the individual may be
19 more susceptible to developing this disorder because
20 of their genetic background?

21 A Yes, and I'll later point out that we now
22 have evidence of a specific gene that has now been
23 found that is affected by mercury.

24 Q Thank you.

25 A The cause of pink disease was believed to be

1 a hypersusceptibility of mercury, in particular
2 mercurous mercury. The medical establishment would
3 not accept mercurous mercury in the teething powders
4 as the cause.

5 Now, let me say the American medical
6 establishment has always practiced excellent medicine.
7 We're healthy for this very good reason. But, it has
8 also been extremely conservative to new ideas.
9 Because pink disease has never been proven by the
10 scientific method to be mercurous mercury, but when
11 the government prohibited the use of mercurous mercury
12 in teething powders pink disease disappeared.

13 Again, we must ask were the 5.5 to 33
14 percent fatalities due to hypersusceptibility to
15 mercurous mercury toxicity?

16 Q Doctor, you indicate that there might be a
17 potential genetic susceptibility to developing mercury
18 toxicity. Are there any studies that support what
19 you're saying?

20 A Ma'am, yes. So the question really is is
21 there evidence for genetic differences or
22 hypersusceptibility in response to mercury exposure?

23 Professor Woods at University of Washington,
24 who has worked with mercury for many, many years and
25 worked with dentists, showed that for dentists with

1 low level occupational exposure to mercury 85 percent
2 had the expected urinary porphyrin profile.

3 Now, porphyrins are chemicals in our body
4 that are on the way to making the hem of hemoglobin,
5 so it's a very important pathway. What happens in
6 this pathway as far as a change in the pathway can be
7 detected by examining the urine for porphyrins, so
8 this is porphyrinuria or a porphyrinuria state.

9 Woods has found, and it's now published in
10 one of our primary, first class, international, peer
11 reviewed toxicology journals, that 85 percent of the
12 dentists with a low level occupational exposure had
13 the expected urinary profile. The expected urinary
14 profile is different from people not exposed at all.
15 There are certain porphyrins that appear in the urine.

16 Fifteen percent of these dentists with the
17 same general exposure had atypical porphyrinuria.
18 They had a new compound, a new porphyrin that was
19 found in the urine. This new compound was due to what
20 we call polymorphism or changes in the letters of the
21 genetic code in the gene.

22 The matter was due to polymorphism in the
23 human gene that modifies the effect of mercury on a
24 biological process. This human gene is a tongue
25 twister, the coproporphyrinogen oxidase gene. This

1 has been published. It was published in 2005, and
2 there have been subsequent papers.

3 Now, mercury review articles do not mention
4 this. All the articles that some of my dearest
5 friends that I have the greatest respect for just
6 don't mention this article because they obviously are
7 ignorant of this article, or as we get older we get
8 more narrow in our vision and perhaps those who write
9 some of these articles just don't realize that
10 genetics has become more and more important in
11 toxicology.

12 So the mercury review articles do not
13 mention this perhaps because the authors are not
14 cognizant of genetics and genetic toxicology as an
15 important area of human toxicology.

16 The genetics of mercury toxicity is just
17 beginning, and this paper of Jim Woods is going to be
18 a classic as a first one. This is potentially a
19 biomarker that we can test people in the future as to
20 whether they are going to be susceptible to mercury
21 toxicity.

22 Next slide?

23 Q Doctor, how does this relate to autism?

24 A Okay. I'm going to offer you evidence to
25 try to answer the question is autism a mercury efflux

1 disorder. Now let's define what a metal or mercury
2 efflux disorder is because there is good medical
3 evidence that we have such disorders.

4 Metals get into our body from our food, from
5 the air that we breathe, gets into the blood,
6 transported to tissues, and normally because of the
7 homeostatic mechanisms and a large accumulation of
8 toxic levels of those metals are prevented by a
9 mercury efflux, a transport system that takes the
10 mercury out of the cell or the metal out of the cell.

11 Could you go back, please? I'm not ready
12 for that. So an efflux disorder is a problem with
13 getting a metal, in this case mercury, out of a cell.

14 So what's the evidence for this? Let's skip
15 the next slide. We'll come back to that much later.

16 Wilson's disease. All right. Wilson's
17 disease has been known since the late 1800s. It's a
18 genetic disorder characterized by a large amount of
19 copper in the tissues. People with Wilson's disease,
20 or another name for it is hepatolenticular generation.
21 People with this disease cannot get rid of copper.
22 The copper accumulates in the brain, in the stem in
23 particular, and in the liver.

24 My first academic appointment was at
25 Vanderbilt University School of Medicine, and a

1 neurologist called me one day and said hey, Vas, I
2 hear you're making penicillamine in the lab as a
3 possible cancer chemotherapeutic agent. I said yes,
4 Burt, we have plenty. Why?

5 He said well, did you see that paper by John
6 Walsh from Cambridge? I said yes. Why? Do you have
7 a Wilson's disease patient? He said come to my office
8 tomorrow morning. I went there, and in a few minutes
9 a woman staggered in, hardly able to walk, hardly able
10 to talk, about 24, 25 years of age.

11 In those days, the FDA regulations
12 practically did not exist, so we took some
13 penicillamine, and we very carefully prepared it, gave
14 it to the pharmacist in our hospital, and the
15 urologist gave the penicillamine to this woman.

16 A month later Burt Sprofkin called me into
17 his office and said come and see. I walked into the
18 office. The young woman stood up, came over and
19 kissed me on each cheek. I was a very young man then.
20 We just didn't do that sort of thing. She was
21 normal.

22 The Wilson's efflux disease is now
23 treatable. It's one of the few genetic diseases that
24 you can give a chelating agent to and the signs and
25 symptoms disappear. We now know -- this happened

1 maybe five or 10 years ago -- that Wilson's disease is
2 due to a mutation in a gene called the ATP7B gene.

3 Next slide, please? This gene codes for the
4 ATP7B protein, which is a copper transport protein,
5 the protein that allows copper efflux. This is
6 expressed primarily in the liver where it's deficient,
7 like in Wilson's disease.

8 The next slide, please? There is hepatic
9 and central nervous system copper accumulation and
10 toxicity.

11 Can everyone hear me all right?

12 MALE VOICE: Yes.

13 THE WITNESS: Thank you. There are signs of
14 hepatic and central nervous system or brain signs and
15 symptoms.

16 What is unusual about Wilson's disease is
17 it's a treatable genetic disorder, so we think other
18 efflux diseases -- maybe even autism -- are treatable.

19 Next slide, please?

20 BY MS. CHIN-CAPLAN:

21 Q Doctor, before we move on, copper. Is that
22 considered to be a heavy metal?

23 A Yes, copper is a heavy metal.

24 Q As is mercury?

25 A As is mercury.

1 Q Doctor, have there been other studies that
2 support what your thinking is, that autism could
3 potentially be an efflux disorder?

4 A Let me review some papers if I may. The
5 first paper is entitled *Reduced Levels of Mercury in*
6 *First Baby Haircuts of Autistic Children*. Amy Holmes
7 was a practitioner, a private practitioner, not
8 connected with a university, not connected with a
9 research group, treating autistic children in Baton
10 Rouge. She thought that she knew about the
11 speculation and thimerosal being involved in autism,
12 and she decided that one way that we may be able to
13 show whether this is snow or not is to get baby hair.

14 The first haircut. Most of us who have
15 children still have first baby haircut. My wife won't
16 let me throw ours away anyway. So she collected this
17 from her parents of her patients who had autism and
18 also took some controls, and she was able to show as
19 the next slide will show you that the mercury level in
20 the hair of autistic children was much less than in
21 the control group.

22 Now, this shocked me at first because I was
23 not thinking about mercury efflux disorder. Now, this
24 study has been confirmed by the MIT group. There's a
25 very good group at MIT. This original study used a

1 commercial lab that used atomic absorption detection.

2 The MIT group used a more sophisticated detection
3 system.

4 So two different systems have shown that
5 autistic children have less mercury in their hair than
6 the control group. There have been other criticisms
7 that Amy Holmes is a private practitioner, what do
8 private practitioners know?

9 Q Doctor, before you go on, so the fact that
10 they have less mercury in their hair than controls,
11 what does that mean?

12 A It means that, well, we know that the hair
13 is an excretory organ and that the hair is reflective
14 of the mercury or the metal in the blood, and the
15 blood is a reflection of the mercury in the tissues,
16 and so the fact that the autistic children had less
17 mercury in their hair was a hint or indication that
18 perhaps there was mercury efflux disorder.

19 Q Thank you. Was there another study that
20 supports your belief that mercury autism could
21 potentially be an efflux disorder?

22 A Dr. Jeff Bradstreet was the lead author in a
23 study entitled, *A Case Control Study of Mercury Burden*
24 *in Children With Autistic Spectrum Disorders.* This
25 group gave DMSA a chelate agent that would bind the

1 mercury in the cell and would not need the efflux
2 mechanism. The DMSA mercury chelate would come out of
3 the cell and the mercury would be excreted in the
4 urine.

5 This study has shown that DMSA increased the
6 urinary excretion of mercury three to sixfold more
7 than found in nonautistic children. Now, this is an
8 indication of an increased body burden of mercury in
9 these children.

10 Q Now, doctor, you say it's a chelating agent.
11 What exactly is a chelating agent?

12 A The word chelating comes from the word
13 chelos from Greek which means claw, like the claw of a
14 lobster. You can think of a chelating agent as the
15 lobster claw that hooks up and ties up the middle.
16 The chelating agent has a greater affinity for that
17 metal than the protein to which the metal is attached
18 in the cell. The metal and the chelating agent form a
19 chelate.

20 The chelate is also more water soluble than
21 the metal by itself. You must remember metals just
22 don't float around in the body themselves. Metals are
23 attached to proteins and other self-hydro groups.

24 This chelating study is an indication of an increased
25 body burden.

1 Q Doctor, so is this like an artificial means
2 to remove a toxic substance that the body itself
3 cannot remove?

4 A Yes. Yes. Now, there's one more critical
5 study. When I was asked to testify before the
6 Institute of Medicine I pointed out that it was a
7 shame that with all the money that has been spent to
8 study autism no one had gotten tissues that were
9 available at various banks of autistic children to
10 show whether there was an increased concentration of
11 mercury in the tissues because if there is then that
12 would be another piece of evidence for mercury efflux
13 disorder in autistic children.

14 Just within the last month or so I think the
15 next slide will show a study by Adams in 2007 where he
16 took baby teeth. Teeth are an organ. They're a
17 nonexcretory organ. They're one of the tissues or
18 organs of our body.

19 Baby teeth were used by Nedelman at Harvard
20 many years ago to show that children exposed to levels
21 of lead in which there are no obvious signs of
22 toxicity, these children with subclinical lead
23 exposure as we called it had teeth that contained high
24 amounts of lead in that case and their intelligence
25 was impaired. So the use of baby teeth for detecting

1 mercury, or lead, or other metals is well-documented
2 in the scientific literature.

3 What Adams found was baby teeth mercury in
4 autistic children is greater than in nonautistic
5 children. In his controls he was able to show the
6 zinc and the lead were not different. It was just the
7 mercury that was different. So again it appears
8 autistic children have a greater body burden of
9 mercury.

10 Q Doctor, what do these four papers tell you
11 about the relationship between mercury and autism?

12 A On the next slide, please. Significance of
13 these four papers. Next slide. Autistic children
14 lack an effective mercury efflux system. They can't
15 get rid of mercury in the cell. They can take mercury
16 into the cell, but they can't get rid of it. That's
17 true for their brain, it's true for about all the
18 tissues in the body.

19 Q And, doctor, when you say it's true for all
20 the tissues in the body does that include the immune
21 system tissues as well?

22 A Absolutely. Absolutely. There are a lot of
23 proteins with self-hydro groups that are in the immune
24 system, as we call this huge system, and the mercury
25 has a great affinity for self-hydro groups and when

1 that combination is made usually that protein cannot
2 do what it's normally supposed to do.

3 Q So, doctor, what would be the danger
4 associated with an inability to excrete mercury from
5 say a system like the immune system?

6 A I'm sorry. I didn't hear you. Would you
7 speak louder, please?

8 Q Sure. What would be the dangers of an
9 increased level of mercury in a body system?

10 A Can we wait until we get to a later point?

11 Q Certainly.

12 A Thank you. This shows you what ethyl
13 mercury efflux from autistic tissue -- if I have a
14 diagram it allows me to clear my thinking. I hope it
15 might help some people here. At the top is
16 nonautistic tissue if you will. The blue spots are
17 mercury. In a normal individual you're going to have
18 the mercury moving from the tissue to the blood.

19 It will move from the blood to the hair or
20 go up the other area to the urine and feces, but
21 essentially it goes to the hair as one of the
22 excretory organs. In an autistic child there is an
23 inhibition of the mercury efflux system so that the
24 mercury stays in the tissue, the blood level is low
25 and the hair level is low.

1 Q And is that an indication that the autistic
2 children are unable to excrete mercury?

3 A Yes. That's a very clear indication. It
4 appears that autistic children lack an effective
5 mercury efflux system, which will affect many body
6 systems including the immune system.

7 Q And, doctor, what would be the effect of
8 having an existing mercury load on the body system?

9 A Can we skip the slide? We first talk about
10 the Pichichero study in which he took normal children
11 and vaccinated them and followed the toxic genetics,
12 how fast the mercury came out, how fast the thimerosal
13 mercury came. The interpretation, these are his
14 interpretations, administration of vaccine containing
15 thimerosal does not seem to raise blood concentration
16 of mercury above safe levels in infants.

17 Ethyl mercury seems to be eliminated from
18 blood rap
19 104%104a the stools after parental administration of
20 thimerosal in vaccines. The problem with this study
21 is it was done with normal children, children who are
22 not autistic, children who do not have a mercury
23 efflux disorder. If he had also taken autistic
24 children, children with a mercury efflux disorder, he
25 would have found that the kinetics were entirely

1 different.

2 He would not have gotten these kinds of
3 figures that are in his paper. The next slide,
4 please? Thimerosal pharmacal kinetics obtained using
5 nonautistic children are not the same as those
6 expected for autistic children. The latter appear to
7 have different efflux kinetics.

8 Q Doctor, with the different efflux kinetics,
9 does that mean that the children retain mercury in a
10 greater amount than control children?

11 A Yes. Yes.

12 Q Doctor, the fact that they retain mercury to
13 a greater extent, is there harm to all the body
14 tissues such as the immune system?

15 A Yes. Wait. Let me first answer your
16 question. I many years ago resigned a tenure track
17 position to go study enzymology with a Nobel Laureate
18 in the Department of Biochemistry at Stanford
19 University School of Medicine, and one thing we
20 learned very quickly was if you wanted to inhibit an
21 enzyme just throw in mercuric mercury. We also could
22 show that you gave mercuric mercury to an experimental
23 anal, that same enzyme would be inhibited in vivo.

24 So we know that mercury gets into all the
25 cells, and in one form or another it will be there and

1 it will affect all the functions that are going on in
2 the cell to a different extent, but certainly the
3 immune system would be one such function. Now, I
4 would also -- if I can have the next slide -- since
5 we're talking about autism, everyone says well, the
6 IOM said the epidemiology studies clearly show there's
7 no connection between thimerosal and autism.

8 There's no cause, it's noneffective. I want
9 to remind all of us that epidemiology studies cannot
10 prove cause and effect. If you go into any medical
11 textbook of epidemiology it will clearly say that
12 epidemiology studies reveal statistical correlations.
13 Now, when you correlate you're comparing one or two
14 items or three or four items. If you don't pick the
15 right data to compare, you don't pick the right groups
16 to compare, then you're going to get a negative
17 answer.

18 The key to being a good epidemiologist is to
19 pick the right data. This certainly has not been done
20 in my opinion.

21 Q Doctor, have there been recent studies that
22 have looked at the differences between methyl mercury
23 and ethyl mercury in primates?

24 A No. There has been a very nice study by Dr.
25 Tom Burbacher, et al., who has been working with

1 methyl mercury since at least the 1990s. If I can
2 have this next slide, please? I think it's the next
3 slide. Here we are. Thank you. He took infant
4 monkeys. You can't do these studies obviously in
5 human infants, but he took infant monkeys and gave
6 methyl mercury by oral gavage and gave thimerosal by
7 injection, trying to replicate as much as possible the
8 vaccine schedules in a monkey.

9 What he was able to show was that methyl
10 mercury had a half life of 21.5 days in these animals
11 whereas thimerosal had a biphasic half life, one at
12 2.1 days and one at 8.6 days. It's interesting to
13 note that this -- again, these are normal animals --
14 8.6 days is not too far away from the value the
15 Pichichero study showed in humans.

16 What was of very great interest, especially
17 to me and to other people that are very much
18 interested in this sort of thing, is that even though
19 the total mercury in the brain of the monkeys
20 receiving thimerosal was one-third that of the total
21 methyl mercury administered to animals the brain
22 inorganic mercury, which many of us believe to be
23 very, very toxic, as a percentage of the brain total
24 mercury was 34 percent.

25 Thirty-four percent of the total mercury in

1 the brain was mercuric mercury for those animals who
2 got thimerosal while only seven percent of the total
3 mercury in the brains of the animals getting methyl
4 mercury was inorganic.

5 Q So what is the significance of that?

6 A That these two agents are doing different
7 things to the brain. That the thimerosal in
8 particular is leaving in the brain a form of mercuric
9 mercury that's going to stay there a very, very long
10 time. Next, I think.

11 Q So, doctor, when you compared methyl mercury
12 to ethyl mercury did you come to any conclusions at
13 all?

14 A There's a tremendous amount of scientific
15 literature dealing with methyl mercury. It's been
16 studied a long, long, long, long time. There's not as
17 much with ethyl mercury. Although the two molecules
18 methyl mercury and ethyl mercury are different and
19 many of the properties are different there are also
20 similarities. You can't say there are no
21 similarities.

22 The distribution in the blood, the
23 compartmentalization in the blood of methyl mercury
24 and ethyl mercury are the same. The main route of
25 excretion for both of them is via the feces and the

1 bile. Now, the methyl mercury scientific literature
2 can serve as a guide or a path for investigating ethyl
3 mercury, and a lot of people are doing this at the
4 present time.

5 Q Doctor, when you looked at this data did you
6 come to any conclusions about autism and its
7 relationship to mercury?

8 A In my opinion the scientific evidence
9 supports the concept of mercury containing compound
10 thimerosal triggers a response in many systems, let's
11 say in the immune system. Later on I'll show a
12 diagram that will pull all this together for you if I
13 may. But I also want to point out that most complex
14 diseases are the results of three factors: genetic
15 susceptibility, environmental exposures and the stage
16 of development.

17 I think the next slide will have that figure
18 hopefully. Here we are. Again, you must forgive me.
19 I have to see things more than just think about them.
20 This is a possible path for ethyl mercury toxicity
21 that I've tried out on some of my associates and
22 bright students. We have thimerosal that as soon as
23 it gets into the body it's going to be converted into
24 ethyl mercury.

25 That ethyl mercury is a form of

1 environmental stress if you will, and the
2 susceptibility of people to ethyl mercury, probably
3 there is as I show you the genetic component of the
4 dentist with the amalgams probably effective here, and
5 the environmental stress of ethyl mercury goes on to
6 cause immune disregulation. The immune disregulation,
7 the result of that will be immunosuppression.

8 Now, if there's a measles virus in the system
9 at the time this immune suppression should allow that
10 measles virus to exert its pathogenic effects and this
11 should cause encephalopathy going on to autism. Now,
12 another way of looking at it also is that ethyl
13 mercury causes a decrease of glutathione. Glutathione
14 is the primary protection in the body against mercury.
15 It transports mercury out of the cell.

16 It transports mercury out into the bile.
17 It's a very essential component as far as safety of
18 mercury or the decrease of toxicity of mercury. The
19 decreased GSH will result in an oxidative stress and
20 increase the amount of free radicals and both the
21 ethyl mercury directly where we have this
22 environmental window -- the brain as you remember is
23 developing continuously at least until puberty and
24 some people will say it's developing even after
25 puberty.

1 So we have these processes going on in the
2 brain and we know from the *Biology of Development*
3 *Annals* that these windows are very, very narrow,
4 they're very narrow, and that the oxidative stress or
5 the ethyl mercury can affect one of these
6 environmental windows at a particular time. Now,
7 we're often asked why didn't everyone, why didn't
8 every child that gets vaccinated get autism?

9 Now, I want to remind you that not every
10 child got his second batch of vaccination at age one
11 month. Some got it at age one month plus three days,
12 some got it at age one month, five days, some got it
13 at age one month minus two or three days. So this
14 window could be a very narrow one where ethyl mercury
15 or the oxidative stress could have this affect.

16 So one possible explanation as why all
17 children didn't get autism from vaccination is that
18 they all were not vaccinated at exactly the same time
19 in development.

20 Q So, doctor, are you saying that the
21 environmental agent has to come in at a particular
22 point in time to cause harm?

23 A I didn't quite hear what you said.

24 Q I said are you saying that the environmental
25 agent has to come in at a particular point in a

1 child's development to cause harm?

2 A Yes. Absolutely. We know that from studies
3 with many, many agents. Textbooks are filled with
4 agents that have a specific time in which they exert a
5 toxic effect, and if the exposure is during that time
6 you get that toxic effect, if it's after that time
7 there will be no toxic effect, if it's before that
8 time there will be no -- so there's a window for every
9 process.

10 Q And does that include the immune system as
11 well?

12 A Absolutely.

13 Q Now, doctor, at some point in time did you
14 determine whether the amount of mercury that Michelle
15 Cedillo received exceeded any reference point?

16 A Yes. What we're plotting here is first of
17 all the EPA RfD down in the bottom. They should be
18 different symbols, but all right. We'll take the
19 symbols that we have. And then we're plotting the
20 micrograms of mercury per kilogram body weight for
21 Michelle Cedillo.

22 At the first day of her life, she received
23 her first vaccination, and at that time, that
24 vaccination gave her 34 times in one time, a bonus, 34
25 times the dose that's considered the EPA RfD for

1 methyl mercury, all right? At two months it was 43
2 times the EPA RfD. At eight months you can see 36.
3 So these are large doses compared to what the EPA
4 considers a safe, continuous dose of methyl mercury,
5 and these doses of thimerosal are given at one time
6 not every day over a period of time.

7 The next slide will show something about the
8 cumulative dose. We're now plotting for the Cedillo
9 child the cumulative mercury exposure and comparing it
10 to the standard EPA RfD for methyl mercury. You can
11 see that the exposure, we're not talking about body
12 burden now we're talking about exposure, what the
13 child was exposed to, really 10 micrograms of mercury
14 per kilogram, which is almost 100 times more than the
15 RfD.

16 Q Doctor, did you come to any sort of
17 conclusions whether the thimerosal dose that Michelle
18 Cedillo received was a substantial contributing factor
19 to the development of her neurodevelopmental problems?

20 A Yes. Michelle Cedillo received 75
21 micrograms of mercury from ethyl mercury of thimerosal
22 containing vaccines during the first four months of
23 her life. By 18 months of age she received a total of
24 137.5 micrograms of mercury from her vaccines. No
25 matter how one calculates it and compares it these are

1 not normal exposures of a child to a toxic agent,
2 especially if she should have genetic hyper
3 susceptibility to mercury species. Next slide,
4 please? Okay.

5 Q Doctor, in your opinion the dosages of ethyl
6 mercury that Michelle Cedillo received, could that be
7 a substantial contributing factor to the onset of
8 immune dysfunction?

9 A Absolutely. There are papers, especially
10 from Scandinavian countries, very good papers, that
11 show that mercury will disturb immune function and
12 disturb immunoregulation. No question about it.

13 Q And, doctor, having given all of this
14 information to the Court would you like to summarize
15 what your opinion is?

16 A All right. The chemical forms of species of
17 mercury are different chemically and have different
18 toxicological properties. The greatest exposure to
19 mercury in the population is via dental amalgams. The
20 CNS, the brain, the central nervous system of the
21 fetus and children are most vulnerable to elemental
22 and organic mercury. Medical ignorance and
23 conservatism were responsible for Pink Disease being
24 around as long as it was.

25 Methyl mercury from fish can accumulate in

1 women and be transferred across the placenta.
2 Scientific evidence supports the occurrence of a
3 mercury efflux disorder in autistic children. Ethyl
4 mercury is converted to mercuric mercury faster than
5 occurs for methyl mercury.

6 Mercuric mercury in the brains of ethyl
7 mercury treated infant monkeys was 34 percent of the
8 total mercury, but for the methyl mercury treated
9 animals it was only seven percent as shown by
10 Burbacher, et al. Although the two molecules methyl
11 mercury and ethyl mercury are different in structure
12 and many of their properties are different there are
13 similarities.

14 Methyl mercury can act as a guide for
15 understanding ethyl mercury. For some reason the next
16 sentence did not come across here, and I have it if
17 the Court will allow me to read it. It is plausible
18 that Michelle Cedillo may have genetic hyper
19 susceptibility to mercury species which would trigger
20 unusual immune and toxic responses. I think that's
21 the last one. Do I have the next one? Yes.

22 MS. CHIN-CAPLAN: Thank you, Doctor.

23 SPECIAL MASTER HASTINGS: Thank you, Ms.
24 Chin-Caplan.

25 Did the Respondent have any cross-

1 examination for this witness?

2 MR. MATANOSKI: Actually, we do, Your Honor,
3 but we thought in view of the time we were going to
4 ask for a short break before we did our cross anyway,
5 but perhaps we should just take a lunch hour now and
6 come back and do the cross after that.

7 SPECIAL MASTER HASTINGS: Does that sound
8 reasonable to you, Ms. Chin-Caplan?

9 MS. CHIN-CAPLAN: Yes. Do you know how long
10 you're going to be for the cross?

11 MR. MATANOSKI: Probably about an hour.

12 SPECIAL MASTER HASTINGS: All right. With
13 no objection, let's go ahead and take our lunch break
14 now, and we'll start again in one hour. It's now
15 12:10. We'll start about 1:10.

16 (Whereupon, at 12:10 p.m., the hearing was
17 recessed, to reconvene at 1:10 p.m. this same day,
18 Monday, June 11, 2007.)

1 MR. MATANOSKI: This is Dr. Jeffrey Brent.

2 SPECIAL MASTER HASTINGS: Dr. Brent is
3 sitting to your right?

4 MR. MATANOSKI: No.

5 SPECIAL MASTER HASTINGS: Oh, I'm sorry.
6 Your left. Okay.

7 MR. MATANOSKI: Dr. Brent is sitting to my
8 left.

9 SPECIAL MASTER HASTINGS: Right. Right.
10 Okay.

11 Please go ahead then, Ms. Renzi.

12 BY MS. RENZI:

13 Q I'm sorry. Dr. Aposhian, are you a medical
14 doctor?

15 A No, I'm not.

16 Q Are you a medical toxicologist?

17 A It depends how you define the term medical
18 toxicologist. What is your definition?

19 Q My definition would be someone who has both
20 an M.D. and an expertise in toxicology.

21 A I'm not a medical toxicologist.

22 Q Are you an immunologist?

23 A I'm not an immunologist.

24 Q So you don't do experiments on immunology in
25 your lab?

1 A We don't always do experimental immunology.

2 Q You are not a neurologist. Is that correct?

3 A I'm not an M.D., so I can't be a
4 neurologist.

5 Q You don't know how measles virus affects the
6 brain?

7 A I spent 10 years of my research studying
8 virology. I have papers published in *The Journal of*
9 *Virology*. I was the first one to show that a virus
10 could transfer genetic information that was not in it
11 originally. These are published procedures in the
12 National Academy of Sciences and other places. I have
13 a background in virology.

14 Q Have you ever published anything on measles
15 virus?

16 A As far as I remember I don't think I have.

17 Q You are not a geneticist, are you?

18 A I'm considered also to be a biochemical
19 geneticist. The man I worked with for three years at
20 Stanford University got the Nobel Prize for studying
21 while I was with him for determining how DNA was
22 synthesized, and was the first one to synthesize a
23 biologically active DNA molecule. So from the years
24 1959 after I also went to Tufts University School of
25 Medicine to teach to 1967 I was strictly a biochemical

1 geneticist.

2 Q Do you study the genetics of humans? Have
3 you ever done that, sir?

4 A Have I done what? I'm sorry.

5 Q Human susceptibility? Genetic
6 susceptibility in humans?

7 A Yes. We published a paper, it was the first
8 paper of its kind, in which we showed that a mother
9 and her son in Mexico had a polymorphism in the gene
10 that metabolized arsenic to a more toxic form. We
11 have permission. We have a human experimentation
12 committee at our school, and we all must be approved
13 by that human experimental committee or institutional
14 review board before we can do human studies. I do
15 have such permission.

16 Q Have you ever published a peer-reviewed
17 article on autism?

18 A Not a peer-reviewed article.

19 Q I'm sorry, sir?

20 A Not a peer-reviewed article.

21 Q Have you ever published any peer-reviewed
22 articles on genetic susceptibility to mercury
23 toxicity?

24 A Now I've got to stop and think because we've
25 got a lot of mercury papers. I'm not positive, but I

1 think in a symposium talk that I gave at the National
2 Institute of Health on the toxicology of mercury and
3 arsenic that was published in I think *The*
4 *Environmental Health Perspective*. I'm not positive
5 where it was published, but yes, we have published
6 such an article.

7 Q Is that a peer-reviewed article?

8 A Absolutely. It's sponsored by the National
9 Institute of Environmental Health Sciences.

10 Q You've published several articles on
11 mercury. Is that correct?

12 A Many, and they're all in peer-reviewed
13 journals. I think the first one was probably in 1996.

14 Q When is the last time you published a peer-
15 reviewed article on mercury?

16 A On mercury?

17 Q Yes.

18 A I don't remember, but I want to say maybe
19 1999 or 2000. It would be an *Environmental Health*
20 *Perspectives* article. We published so many papers I
21 can't tell you exactly what year what we did.

22 Q Of the articles you had published on mercury
23 have you ever published a peer-reviewed article on
24 thimerosal toxicity?

25 A No. We've done research on it, but they're

1 not quite ready for publication yet.

2 Q On ethyl mercury toxicity?

3 A On thimerosal.

4 Q Would you agree that the majority of your
5 research has been in the area of arsenic and lead
6 toxicity?

7 A Certainly not in lead. I can't even
8 remember a paper we've ever published in lead
9 toxicity.

10 Q On arsenic toxicity?

11 A Arsenic toxicity in recent years. In the
12 time between 1954 and 1959 we only published on
13 mercury, and then we started publishing on mercury
14 again. The last human study we did in mercury was
15 done in Mexico where we mobilized mercury in people
16 that were toxic to mercury. I think that was done I
17 want to say 1997 or 1999. I don't have my CV before
18 me, but the first author was Dr. Gonzalez.

19 Q You say toxic to mercury. What kind of
20 mercury are you describing?

21 A I didn't hear the first part of your
22 question.

23 Q You said that it was a study in Mexico
24 regarding mercury toxicity. Is that correct?

25 A Yes. Yes.

1 Q What type of mercury?

2 A Done so long ago I don't quite remember.

3 Give me a minute to think. These people had been
4 exposed to high levels of mercury. I think, it's been
5 so long ago, that it was due to their working in a
6 fluorescent light factory. The paper is published.

7 Q Would that be mercury vapor? Methyl
8 mercury?

9 A It was probably mercury vapor.

10 Q Mercury vapor. Thank you. Mercury vapor
11 and ethyl mercury are different species of mercury.
12 Is that correct?

13 A I hope you learned that from the talk I gave
14 this morning.

15 Q I did. Thank you. And different species of
16 mercury have different toxicological properties. Is
17 that correct?

18 A Yes.

19 Q Have you ever testified as an expert witness
20 in other litigation?

21 A I've been very fortunate that most of the
22 cases that I've been involved in have been settled out
23 of Court, and so many people think I bring a certain
24 charm to such proceedings, but unfortunately not the
25 case today.

1 Q Have you ever diagnosed or treated a person
2 with ethyl mercury toxicity?

3 A I'm not a physician, so I would not treat
4 anyone.

5 Q So you've never treated or diagnosed a
6 person with any form of mercury toxicity?

7 A I have been asked my advice by physicians
8 who think they may have a person who has mercury
9 toxicity, and I have given them my opinion, but I did
10 not do a diagnosis.

11 Q Have you reviewed the medical records of
12 Michelle Cedillo?

13 A I have reviewed some of them, but not all of
14 them.

15 Q What records did you review?

16 A A notebook about that thick and that's about
17 all I can tell you at this time. But again, I'm not a
18 physician, and I certainly would not be expected to be
19 expert on the various medical evaluations of such a
20 person.

21 Q What types of records did you review? Did
22 you review her immunization records? Did you review
23 her general medical records?

24 A I reviewed her general medical records.

25 Q And how many did you review approximately?

1 A I don't count such things. I'm sorry.

2 Q More than 100?

3 A Again, I don't count such things. I just
4 look at things, read them, try to store them in my
5 mind. I don't put a number on number of papers that I
6 read. I either read a lot or a few, and I read a lot.

7 Q You read a lot. Is there any evidence or
8 allegation that Michelle Cedillo's autism was caused
9 by exposure to mercury vapor?

10 A I don't know. I don't remember seeing that
11 data if it was there.

12 Q Is there any evidence or allegation that
13 Michelle Cedillo's autism was caused by exposure to
14 methyl mercury?

15 A I don't know of any case where anyone would
16 say methyl mercury per se was the cause of autism or
17 even speculate along such lines.

18 Q There's no evidence, are you saying, that
19 methyl mercury causes autism?

20 A I'm saying that I know of no evidence that
21 methyl mercury will cause autism.

22 Q Is there any evidence or allegation that
23 dimethyl mercury caused Michelle Cedillo's autism?

24 A I doubt very much that Michelle was exposed
25 to dimethyl mercury unless she went to a dump. In the

1 literature there's evidence that certain dumps emit
2 dimethyl.

3 Q You're saying no, sir, correct? That
4 there's no allegation of dimethyl mercury?

5 A Yes. You're correct.

6 Q Okay. Thank you. Is there any allegation
7 or evidence that Michelle Cedillo's autism was caused
8 by mercuric salts?

9 A By thimerosal?

10 Q By mercuric salts.

11 A By mercuric salts?

12 Q Yes.

13 A I know of no evidence.

14 Q You know of no evidence.

15 A Excuse me.

16 Q Okay.

17 A Let me finish please, okay? However, the
18 thimerosal that is in her vaccines would be expected
19 to be converted to ethyl mercury which would be
20 transported to the brain and in the brain the ethyl
21 mercury would be converted to mercuric mercury.

22 Q Thank you. Are you familiar with the
23 reference book *Casser and Duals*?

24 A Of course. Yes, I am.

25 Q Is it a well-regarded reference book used by

1 toxicologists?

2 A It is a reference book used in toxicology
3 classes.

4 Q Would you agree with the statement from that
5 reference that, "no other metal better illustrates the
6 diversity of affects caused by different chemical
7 species than does mercury"?

8 A I thought I said in my opening remarks that
9 the reason I was reviewing the forms of mercury for
10 the Court was because of the diversity.

11 Q So you agree with that statement?

12 A Yes.

13 Q Would you agree that the toxicity of one
14 form of mercury does not automatically apply to other
15 forms of mercury?

16 A I can't quite agree with that because all
17 the forms of mercury that I know of, if they get into
18 the central nervous system, in fact get in the cells,
19 are going to be converted into mercuric mercury, and
20 there's a standing argument as to whether the toxicity
21 of organic mercury is due to the mercuric mercury per
22 se, or to the let's say organic mercury per se, or a
23 combination of both.

24 Q You stated earlier that people are exposed
25 to mercury on a daily basis. Is that correct?

1 A I would hope to say that what form of
2 mercury? We don't like to use the term mercury
3 without specifying what form of mercury we're talking
4 about. Like in that chart I gave we had a column of
5 amalgam mercury or elemental mercury, a column for,
6 you know, organic mercury or mercuric mercury and a
7 column for methyl mercury.

8 Q So was your testimony that people are
9 exposed to methyl mercury on a daily basis?

10 A People are exposed to methyl mercury if they
11 eat fish or seafood.

12 Q Or live near power plants?

13 A Pardon?

14 Q Power plants?

15 A No. A power plant emits elemental mercury.
16 It doesn't emit, as far as I know, methyl mercury.
17 The elemental mercury is then spewed out into the
18 atmosphere, and when it rains it is washed into the
19 sea water or into the lakes and settles and there is
20 converted to mercuric mercury again, settles down and
21 is converted by bacteria to methyl mercury.

22 Q Okay. I'll rephrase my question. Would you
23 agree that people are exposed to both organic and
24 inorganic mercury on a daily basis?

25 A I think you have to be very careful now.

1 That's why we use species. For example, the major
2 form of inorganic mercury is mercuric mercury.
3 Mercuric mercury most of a general population is not
4 exposed to to any great extent. Mercuric mercury
5 toxicity is almost only seen in occupational setting.

6 Q Would you agree that any substance is either
7 toxic or nontoxic based upon the dose?

8 A No. This is an ancient form of quotation
9 that until recently we taught in medical schools, and
10 in undergraduate school, and in graduate school. We
11 now have to consider the hyper susceptibility of
12 people. For example, you might be poisoned by X
13 amount of some form of mercury. I might be poisoned
14 by one-hundredth of that amount because I may have a
15 genetic hyper susceptibility.

16 So the dose that I'm given will be very
17 harmful to me, but that dose won't be harmful to you.
18 So no longer can we use that ancient saying, and it's
19 very ancient. This is now the year 2000, it's not the
20 year I think 1000 B.C. or something like that when
21 Parcellius said this. We no longer believe that the
22 dose determines the poison. That is an antiquated
23 belief in this modern age because now we know about
24 genetics and hyper susceptibility of some people.

25 Q So toxicologists don't consider dose when

1 considering the toxicological effects of substances?

2 A That's not what you asked me originally. If
3 we can go back to what you just asked me? I'm not
4 certain that's the question that you asked me.
5 Essentially, we take dose in consideration, but it's
6 not the only thing that determines toxicity. Dose is
7 not the only factor that determines toxicity.

8 Q Would you agree, though, that any substance
9 in a sufficient dose could be toxic to humans?

10 A Of course. I could kill you by making you
11 drink so much water that it would overwhelm your
12 system.

13 Q But you do not agree that dose makes the
14 poison?

15 A I don't agree that only dose makes a poison.
16 I mean, that is an antiquated belief today. If I had
17 a graduate student here answering your question he
18 would laugh. He would laugh because students are more
19 up to date than many of us.

20 Q So you disagree with that statement? You
21 don't agree that dose is the most important and
22 fundamental principle in the study of toxicology?

23 A I think I've said that in the past it was
24 considered to be important, but today we know other
25 things are just as important, primarily the genetics

1 of the individual, especially the hyper susceptibility
2 of the individual.

3 Q What is the normal mercury blood level for
4 an adult?

5 A I don't know what the normal one is, but I
6 would say that if it's under five micrograms per liter
7 is considered to be not of clinical concern. That's
8 probably the average we usually see in an ordinary
9 person.

10 Q What is the normal mercury blood level for a
11 child?

12 A Again, this depends on what the child has
13 been exposed to, and there are all sorts of ranges. I
14 could not without consulting a reference book come up
15 with the range and dose for a child depending on his
16 age and sex.

17 Q What is a high mercury blood level?

18 A Again, I'm not a physician, but if someone
19 were to ask me in class that question we would usually
20 say that most physicians and most emergency medicine
21 books will say that anything above 15 micrograms per
22 liter of blood should have medical attention. Some
23 people say even 20 micrograms per liter of blood
24 should have medical attention.

25 Q You use exceedingly high in your report.

1 What is an exceedingly high mercury blood level?

2 A Where did I use the term exceedingly high?

3 Where did I use the term exceedingly high? I may
4 have, but I just don't remember. I like to be
5 refreshed.

6 Q Okay. I will find it. Did you use the word
7 horrendously high?

8 A Pardon?

9 Q Horrendously high?

10 A I don't have it in front of me. This is a
11 Court of Law and I want to tell the truth, so I don't
12 know until I see what you're talking about.

13 Q You use it on page 4 of your report.

14 A I don't have the report with me, so if you'd
15 read or if someone could let me see it.

16 Q I can read it. When you were reporting
17 about the dimethyl mercury exposure.

18 A Yes.

19 Q Her blood mercury levels were horrendously
20 elevated. You used horrendously elevated.

21 A Yes. If I remember *The New England Journal*
22 *of Medicine* article, that Karen Winterhaller had blood
23 levels I want to say 2,000 or 20,000 micrograms per
24 liter, but I honestly don't remember the exact number.
25 In many review articles it says that's the largest

1 concentration of mercury that's been found in the
2 blood of almost any human being.

3 Q Dr. Aposhian, when you discuss the several
4 cases of mercury toxicity in your report do you
5 mention the dose amounts of mercury or the mercury
6 blood levels in those persons that suffered adverse
7 effects?

8 A I'm sorry. I can't hear you.

9 Q I'm sorry. I'll stand very close to the
10 microphone.

11 A You've got to speak in the microphone,
12 please. I'm also an old man, you know, and I can't
13 hear.

14 Q I will try to speak up. I apologize.

15 A Thank you.

16 Q When you discuss the several different
17 studies of mercury toxicity you never mention the dose
18 amounts of the mercury or the mercury blood levels in
19 those persons that suffered the adverse effects. Is
20 that correct?

21 A I don't have the report. If someone would
22 give me a copy of the report?

23 Q Have you discussed the dose amounts today?

24 A Pardon?

25 Q Have you discussed any dose amounts today or

1 mercury blood levels today in your review?

2 MS. CHIN-CAPLAN: Special Master, if there's
3 a question about a particular page of Dr. Aposhian's
4 report could Ms. Renzi kindly give us the page number?

5 SPECIAL MASTER HASTINGS: Ms. Chin-Caplan,
6 let's let her go on. She's asking a general question
7 first.

8 If you get to a particular question just
9 give us the page number.

10 MS. RENZI: I can hand the paralegal
11 anything I refer to. It would probably be very
12 difficult for me to walk over to Dr. Aposhian with
13 anything, but I'll just ask the paralegal to --

14 THE WITNESS: Do you have a copy? I would
15 appreciate it.

16 BY MS. RENZI:

17 Q Did you mention either doses or mercury
18 blood levels in any of your discussions of mercury
19 toxicity today?

20 MR. MATANOSKI: For the record, Dr. Aposhian
21 has been handed a copy of the Exhibit P.

22 SPECIAL MASTER HASTINGS: Okay. Now, Dr.
23 Aposhian, I think the last question she just asked
24 you, you are asking now about his testimony today
25 rather than his report?

1 MS. RENZI: Correct.

2 MS. RENZI:

3 Q I asked if in your discussions today with
4 Ms. Chin-Caplan did you mention either dose amounts or
5 mercury blood levels in the persons that suffered
6 adverse effects from mercury toxicity?

7 A I don't recall, but I don't think so.

8 Q One of the things you mention in your report
9 is the Fagen article. Are you familiar with that
10 article?

11 A Yes.

12 Q In the Fagen article is a report of death in
13 infants treated with high doses of thimerosal. It's
14 on page 4 of your report.

15 A Yes. I know that. And so what is your
16 question, please?

17 Q I will ask you in a moment. Please be
18 patient. How were those children exposed to the
19 thimerosal in the Fagen report?

20 A I don't recall. I want to say it may have
21 been injected, but I haven't read that paper six,
22 seven months.

23 Q Would you accept that it was a topical
24 thimerosal tincture or would you like to look at the
25 article?

1 A If you say it is I'm willing to accept your
2 word.

3 Q You can look at the article. We can hand
4 you that article, the Fagen article, which is
5 Attachment P of your exhibit.

6 A Yes. Thank you.

7 MR. MATANOSKI: For the record, Dr. Aposhian
8 has been handed the Fagen article previously referred
9 to.

10 THE WITNESS: And what's your question,
11 please?

12 BY MS. RENZI:

13 Q Do you know how long the children were
14 treated with the thimerosal tincture?

15 A Actually, I called Dr. Fagen. He is now
16 retired living in England, and he could not remember
17 the answer to that question. Now, I don't remember
18 whether it's in here or not, but we were trying to
19 find out what some of the blood levels of these kids
20 were, and I see there is one in Table 1 and there are
21 some mercury concentrations. Yes. Now I recall the
22 paper. Yes.

23 Q Okay. Was the exposure to the thimerosal
24 tincture a one time dose or was it a chronic and
25 prolonged period of time?

1 A I'm sorry. You've got to speak in the mic.
2 The acoustics are very, very bad.

3 Q I'm speaking as loud as I can. I apologize.
4 Was the thimerosal tincture applied over a long
5 period of time or was it a single application?

6 A I'm not even certain it says, but again, I
7 haven't read this paper six, seven months. I don't
8 know the answer to your question.

9 Q Does the article report the dose of
10 thimerosal that the children in the study were exposed
11 to?

12 A I thought I asked Dr. Fagen that, and the
13 impression I had from Dr. Fagen's answer was that he
14 didn't remember and that the dose was not mentioned,
15 but again, I have not read this for six or seven
16 months, and I don't know the exact answer to your
17 question.

18 Q But there is a mercury blood level in that
19 report. Is that correct?

20 A There is a blood level in Table 1.
21 Certainly.

22 Q And that's the mercury blood level of a
23 child taken after his death. Is that correct?

24 A Yeah. One child. Yes.

25 Q And what is that mercury blood level?

1 A Three hundred and forty I think it's
2 nanograms per milliliter.

3 Q Would that be about 1,340 micrograms per
4 liter?

5 A It would be -- yes.

6 Q What is the blood mercury level of a child
7 following the receipt of a thimerosal vaccine?

8 A A normal child the blood mercury level is
9 given in the Pichichero paper I guess, but that's a
10 normal child, it's not a child with a mercury efflux
11 disorder.

12 Q And what is that level?

13 A Again, I don't have the paper in front of
14 me, you have it. You probably know it better than I
15 do.

16 Q Well, you also referred to the Stajich
17 article, which is Exhibit --

18 A Forgive me, but you're talking down into
19 your notebook, and I'm sorry.

20 Q Exhibit 2Q of your attachment is Stajich.
21 Mr. Boxler will hand you the article. You filed it
22 with your report.

23 A This is Stajich's paper. And what are you
24 asking about this paper, please?

25 Q This article measured the blood level in

1 infants following hepatitis B vaccination. Is that
2 correct?

3 A Yes.

4 Q And according to that article isn't the
5 blood level of a child who received a thimerosal
6 containing vaccine approximately 2.24 micrograms per
7 liter?

8 A I have to refresh this. Yeah. One
9 postvaccination level is 2.24, the lower level. The
10 higher level is 7.36 of micrograms per liter.

11 Q And isn't the 2.24 micrograms per liter
12 approximately 600 times less than the mercury blood
13 level following exposure in the Fagen article?

14 A Probably.

15 Q You state in your opinion that higher doses
16 of mercury have been shown to be toxic. Do you agree
17 with that?

18 A I need to know the context that is said in.
19 What is the rest of the paragraph, please?

20 Q Are higher doses of mercury known to be
21 toxic?

22 A Are you asking me a question now or are you
23 quoting me?

24 Q Yes. Are higher doses of mercury known to
25 be toxic?

1 A What form of mercury are you talking about?

2 Q Methyl mercury.

3 A Methyl mercury in various doses is toxic.

4 Q Is ethyl mercury?

5 A Ethyl mercury in various doses is toxic.

6 Q What does various doses? You have specific
7 doses at which the mercury can be toxic.

8 A It depends on the species of animal that the
9 study was done on. There are studies by Magos in the
10 rat studies and mouse. I think there are one or two
11 studies by Suzuki from Japan. Again, I don't
12 remember. To most of us toxicologists doses are
13 something that we can look up. We don't have to
14 memorize such things.

15 Q Does the Fagen article tell us nothing more
16 than thimerosal at doses 600 times greater than the
17 amount contained in the thimerosal mercury vaccine can
18 cause an adverse reaction?

19 A That's what the Fagen article says. Yes.

20 Q Does the Fagen article tell us anything
21 about thimerosal at low doses causing adverse effects?

22 A I don't think so.

23 Q Does that article tell us anything about
24 thimerosal causing autism?

25 A Definitely not.

1 Q Does that article tell us anything about
2 thimerosal administered at low doses causing immune
3 suppression?

4 A This article does not deal with that
5 subject. Would you like the references for the
6 articles that do deal with thimerosal and mercury
7 causing immune suppression --

8 Q We can get to those, sir.

9 A All right. Okay. I'll be glad to give them
10 to you know if you'd like.

11 Q No. We can wait.

12 A All right.

13 Q I want to go back to the dimethyl mercury
14 exposure.

15 A Yes.

16 Q And that was the chemistry professor who was
17 exposed to the dimethyl mercury. Is that correct?

18 A You must forgive me. I have hearing aids I
19 paid \$4,000 for, and if you talk in the microphone I
20 can hear you. I know it's natural for you to look
21 down at your notebook, I just can't hear you.

22 Q I'm a little short and getting to the
23 microphone means a big lean here, so I'm doing the
24 best that I can here.

25 A I'm sorry. Thank you.

1 Q Back to the dimethyl mercury exposure.

2 A Yes.

3 Q Did the authors of that article, and that is
4 Article LL -- would you like to see that article, sir?

5 A I wouldn't mind having it. I know of it,
6 but it would help me answer any question that you
7 might have.

8 MR. MATANOSKI: For the record, Exhibit LL
9 was handed to the witness.

10 MS. RENZI: I think it's technically
11 Attachment LL to Exhibit 55.

12 MR. MATANOSKI: Thank you.

13 BY MS. RENZI:

14 Q And that's the Nierenberg paper? Is that
15 correct? Who is the author on that article? Who is
16 the author on that article?

17 A Nierenberg.

18 Q Thank you. Did the authors of that article
19 calculate the dose of dimethyl mercury?

20 A If they didn't calculate it here, they
21 calculated it elsewhere, but I presume it must be here
22 also.

23 Q Do you know what that dose was?

24 A I want to say it was something like two
25 milligrams of dimethyl mercury.

1 Q Two milligrams?

2 A Two milligrams. That's what I sort of
3 remember. I could be wrong, but I think that was the
4 dose that Coxen has told me personally that they made
5 the calculation --

6 Q But you rely on the article. What does the
7 article say, sir?

8 A -- excuse me -- because the density of
9 dimethyl mercury is very high, so there is a lot of
10 mercury in that two milligrams. I'm sure they say
11 what the dose is here. You may know where it is,
12 since you're asking the question. You could tell me.

13 Q On page 1675.

14 A 1675. Way back down there. They say 1,344
15 milligrams.

16 Q Isn't that 1,344,000 micrograms?

17 A That's what most of my students would say,
18 yes.

19 Q And what is the micrograms of thimerosal in
20 the thimerosal-containing vaccine of a Hepatitis B
21 vaccination?

22 A We're talking about dimethyl mercury here.
23 We're not talking about thimerosal.

24 Q I understand that, but my question was --

25 A So to make that comparison is wrong. That's

1 why we emphasize, in my talk, the species of mercury.

2 In answer to your question, the thimerosal
3 vaccine's total, about 180 or 200 micrograms of
4 mercury.

5 Q And the Hepatitis B vaccine.

6 A It's either 12.5 in Hepatitis B or 25.

7 Q So you agree --

8 A Agree to what, please?

9 Q -- that the exposure to dimethyl mercury is
10 not comparable. You can't compare that to an exposure
11 in a thimerosal-containing vaccine.

12 A I don't know of anyone that's made that
13 comparison. All we're saying -- I think most people
14 would want to educated a group to know that dimethyl
15 mercury is the most toxic form of mercury that we know
16 of.

17 Q So this case study simply illustrates that
18 different forms of mercury have different
19 toxicological properties. Is that correct?

20 A I think that's what everyone knows, even
21 before this paper.

22 Q You stated today that inorganic mercury is
23 trapped in the brain and then is not eliminated. Is
24 that correct?

25 A Again, slowly repeat that, please.

1 Q You stated today that inorganic mercury --

2 A Mercuric mercury.

3 Q -- mercuric mercury -- is that inorganic
4 mercury?

5 A It is one form of inorganic mercury.

6 Q It is trapped in the brain --

7 A Yes.

8 Q -- and is not eliminated. Is that correct?

9 A It's practically not eliminated. It stays
10 there for a long, long time.

11 Q And in support of that, you cited to two
12 case studies. Is that correct?

13 A There are two case studies that indicate
14 that, many years after the exposure, the amount of
15 mercuric mercury -- in this case, inorganic mercury --
16 was extremely high and remained that high over a
17 number of years.

18 Q And when was the family in Mexico that you
19 discussed today that consumed a pig following the
20 pig's ingestion of methyl mercury? Is that correct?

21 A Well, the case in New Mexico was a pig
22 knocked over a bottle of a fungicide, which was methyl
23 mercury chloride and drank it, and the next day the
24 family killed that pig and, within a few days, used
25 that for food. There were three children, two very

1 young ones. One died shortly thereafter, and the
2 other one lived for either 20 or 21 years, and, at
3 that time --

4 Q Okay. Can I just interrupt you for one
5 minute?

6 A Let me finish, please?

7 Q Okay.

8 A At that time, 20 or 21 years later, everyone
9 was astounded to see that, in a human being who had
10 been exposed to methyl mercury 20 or 21 years
11 previously, the brain inorganic mercury, mercuric
12 mercury, was 100 times more than normal.

13 Q And I think you stated that earlier today.
14 Do you know the approximate amount of methyl mercury
15 that was consumed by the family members?

16 A I don't think anyone knows that. I don't
17 remember the paper even trying to come to terms with
18 that.

19 Q Do you know over what period of time the pig
20 was consumed by the family?

21 A It was either over a six-month period or a
22 period of one year, approximately. They didn't have
23 freezers in those days in New Mexico.

24 Q But would you agree that the family's
25 exposure to methyl mercury was at a much higher dose

1 than a dose of ethyl mercury that is received through
2 the administration of the thimerosal-containing
3 vaccine?

4 A Of course. Everyone knows that.

5 Q Were mercury blood levels reported in that
6 case?

7 A I don't think so, but I'm not positive
8 because the main emphasis of that paper was the amount
9 of mercury in the adult's brain.

10 Q Did any of those family members develop
11 autism?

12 A This was done, at least, 20 to 25 years ago,
13 which would make it around 1970, I would guess. I
14 don't think autism was a concern of any doctor or
15 anyone making a diagnosis in those days. I don't
16 think physicians were thinking about autism.

17 Q And when was that? I'm sorry. What was the
18 date?

19 A My guess is it's around 1970, but I'm not
20 positive of that.

21 Q Was there any reports that any family
22 members were immune suppressed following the
23 consumption of the pig?

24 A You've got to understand that this was in a
25 very rural part of New Mexico. I don't know whether

1 you've ever been in New Mexico --

2 Q I have.

3 A -- but in the rural parts of New Mexico
4 where people eat pigs that they grow, they are lucky
5 if the physician treating them was even thinking about
6 immune suppression.

7 Q But they did do a case study on this, so
8 there had to be some sort of follow-up of this family.
9 Is that correct?

10 A The only published report on this family
11 that I know of is of the child dying 20 or 21 years
12 later. There may have been another one, but I'm not
13 aware of it.

14 Q Was the mother pregnant when she consumed
15 the methyl mercury in that study? Would you like to
16 see the study? We can hand you that as well.

17 A Pardon?

18 Q Would you like to see the paper by Davis
19 that we're talking about?

20 A If it's that one, yeah.

21 MS. RENZI: That is Attachment N, for the
22 record, of Exhibit 55.

23 SPECIAL MASTER HASTINGS: Okay. Thank you.

24 THE WITNESS: Yes. Now I remember this one,
25 yes. What is your question about it, please?

1 BY MS. RENZI:

2 Q There was a child in that study who actually
3 had prenatal exposure to the methyl mercury. Is that
4 correct?

5 A Again, I haven't read this paper for years.
6 If you say it's correct, I'll have to accept it.

7 Q Well, you cited it in your report, which you
8 wrote on February 16, 2007. So if you haven't read
9 this article in years --

10 A Which said what about a pregnant woman?

11 Q Well, you cited the paper, so I had assumed
12 that you were aware of the study.

13 A I don't think in my paper I say there was a
14 pregnant woman involved. I could be wrong, but,
15 again, I have to read so many papers --

16 Q So you don't know, in the article that you
17 cited, whether there was prenatal exposure to one of
18 the family members. If you don't know, you can just
19 answer no. That's fine.

20 A I didn't hear all of the question.

21 Q I said, So you don't know --

22 A I don't know what?

23 Q -- whether -- if you let me finish my
24 questions, I'll try to remember to have you finish
25 your answers.

1 A I'm sorry.

2 Q So you don't know whether, in the article
3 that you cite, whether one of the family members was
4 exposed to the methyl mercury through consumption of
5 that pig prenatally.

6 A Since this is a court of law, I want to be
7 absolutely truthful, and I have the sneaking suspicion
8 one may have been, but I'm not positive.

9 Q Okay. So you don't know if there were any
10 neurological symptoms of a child due to prenatal --

11 A I could read the paper and find out, but I
12 don't know now.

13 Q We'll move on, sir.

14 A Yeah.

15 Q You also refer to, in your report, the 1994
16 Opitz article, and that is Attachment MM of your
17 exhibit.

18 A Which attachment?

19 Q MM.

20 A MM. Thank you.

21 Q M like in "Mary" M.

22 A Okay.

23 Q If you would like to see it, yes.

24 A Thank you.

25 Q Have you read that article recently?

1 A Yes. This is from Germany.

2 Q When is the last time you read that article?

3 A If I had to make a record of every time I
4 read an article -- I don't keep such things in my
5 mind.

6 Q I didn't ask how many times you've read it.
7 I asked, when is the last time you read it? Have you
8 read it since --

9 A I have no idea. I'm trying to tell you the
10 truth. I have no idea.

11 Q What was that article about?

12 A This is an article, if I remember correctly,
13 of a man being exposed to mercury vapor, metallic
14 mercury vapor, and he was treated with D
15 penicillamine, which we were the first one to use,
16 come up with, as far as a therapeutic agent. Our
17 laboratory did that. They did a body -- again, they
18 found nerve cell damage, as I remember, if I remember
19 correctly. So what else would you like to know?

20 Q In your report, on page 6 --

21 A Page 6 of this article?

22 Q Of your report. I'm sorry, sir, of your
23 report.

24 A Could someone get me my report? If I had
25 known that --

1 Q I think we handed you your report, sir. You
2 should have it.

3 A Thank you. Okay. Page 6. All right. Now,
4 I have page 6.

5 Q Okay. First big paragraph, and after you
6 cite the Davis study, six lines up --

7 A From the bottom?

8 Q Yes, from the bottom of that paragraph.

9 A Of that paragraph.

10 Q You state: "In another study, exceedingly
11 high levels of mercury were demonstrated in a human
12 brain and other organs 17 years after metallic mercury
13 exposure." And my question to you is, what is
14 "exceedingly high"?

15 A It's approximately 2,000 micrograms per
16 kilogram in the brain. Does that answer your
17 question?

18 Q Is that how you define "exceedingly high"?

19 A I would define anything high that's above
20 what we normally see, and this is above what we would
21 normally see.

22 Q But what is "exceedingly high"? Can you
23 quantify "exceedingly high"? Is there a toxicological
24 term that quantifies "exceedingly high"?

25 A No. I would just take the values reported

1 in the textbooks of emergency medicine and the
2 toxicology textbook that you reported. They give
3 normal values, and, depending on how large the number
4 you're talking about is, compared to that base value,
5 I would say it was high or exceedingly high.

6 Q Do you have the Opitz article in your hand
7 now? Do you have the Opitz article in your hand?

8 A Yes.

9 Q Okay.

10 A Yes, it is. I'm looking at Table 2 on page
11 143.

12 Q And is that the mercury urine? There was a
13 mercury urine level in that report. Is that correct?

14 A Certainly, Table 2 doesn't have one, so
15 let's see what Table 3 -- it doesn't have one, so
16 let's see what Table 1 is. Table 1 does not give a
17 urinary value either. In the text, there is a urine
18 value, but my guess is, since this is an autopsy, they
19 probably did not get a urine value, but I don't know.

20 Q Where it says "Case Report" --

21 A Which one do you want, one of these?

22 Q No. I was looking for my glasses, to be
23 honest with you. I'm a little blind with the small
24 print.

25 On the first page of that article --

1 A The Opitz article?

2 Q -- the Opitz article under "Case Report."

3 A On the first page?

4 Q Yes, sir. A male subject, age 57 at death,
5 had worked for 13 years in the recycling of mercury
6 from amalgams with a mercury content of 102 percent.
7 He suffered from an acute exposition of mercury vapor
8 at age 41. Immediately after intoxication, he
9 excreted 1,850 milligrams per liter of urine.

10 My question is, is that the equivalent of
11 1,850,000 micrograms?

12 A Yes, yes.

13 Q Is that how you would define, then,
14 "exceedingly high does," when the mercury excretion --

15 A That certainly is not a low dose. Usually,
16 what you see in the urine is in the order of magnitude
17 of five micrograms per liter or less, sometimes a
18 little more, but this would certainly be a high dose.
19 It would be the exceedingly high dose.

20 Q So could you compare this article, then, to
21 thimerosal content in vaccines, exposure through a
22 thimerosal-containing vaccine?

23 A What part of this article?

24 Q The dose, sir.

25 A No, I cannot.

1 Q You also discussed today and in your report
2 Minamata. Is that correct? At Minamata, there was
3 exposure of methyl mercury through consuming of
4 contaminated fish. Is that correct? Do you know if
5 there were any blood -- I'm sorry. I apologize.
6 Could you answer so your voice can be recorded? You
7 have to answer yes or no. A nod of the head; the
8 court reporter won't pick it up.

9 A I did mention Minamata in the talk to answer
10 the questions that were asked of me earlier.

11 MR. MATANOSKI: I'm sorry. Just for the
12 record, because the witness hadn't responded --
13 because he nodded his head in response to Ms. Renzi's
14 last question, he nodded in the affirmative.

15 THE WITNESS: I apologize.

16 MS. RENZI: It's for the court reporter that
17 it's important that you don't nod your head but that
18 you answer yes or no.

19 THE WITNESS: I understand. I apologize.

20 BY MS. RENZI:

21 Q Thank you. Do you know if any methyl
22 mercury blood levels were measured in any of the
23 victims at Minamata.

24 A I'm certain they were. I don't know what
25 they were, though.

1 Q Would you believe that they would be higher
2 than blood levels following thimerosal-containing
3 vaccine?

4 A I don't know what the data is. It's
5 conceivable that there might have been some people
6 there. I just don't have the data.

7 Q You don't have the data.

8 A Some people could be hypersusceptible and
9 have a low level. I don't have the data before me on
10 it. I'm sorry. I don't know.

11 Q In Minamata, there were also birth defects
12 as a result of pregnant women who consumed fish during
13 their pregnancy. Is that correct?

14 A Yes.

15 Q And you described a cerebral palsy-type
16 syndrome in these children.

17 A Yes.

18 Q Do you know over what period of time the
19 methyl mercury exposure took place in Minamata?

20 A At least two years and maybe even five years
21 and then even more. You must realize that it's, at
22 times, very difficult to get such information from
23 Japan. The word "Minamata" in Japan is now
24 synonymous, because of the effects on the brain, with
25 the word "idiot." So if someone wants to insult you

1 in Japanese, to call you, as we would say, "You're an
2 idiot," he would say, "You're a Minamata."

3 Q But my question to you is, was it a chronic
4 exposure, or was it a short-term exposure?

5 A Again, you're talking about a population.

6 Q Is two years a chronic exposure, or is two
7 years --

8 A But you're talking about a population. Some
9 people would have one meal. It depends on how much
10 fish they ate, but it certainly would not be expected
11 to be a short period. It was chronic exposure.

12 Q So they consumed the fish over an extended
13 period of time.

14 A Yes.

15 Q Thank you. Is there any evidence that the
16 children at Minamata had an increased rate of autism
17 compared to the general population?

18 A Again, people were not aware of autism as a
19 disorder of children at that time, especially in
20 Japan.

21 Q Do any of the neurological symptoms
22 described in these children comport with a diagnosis
23 of autism?

24 A You must realize, again, that the signs and
25 symptoms of methyl mercury toxicity are relatively

1 nonspecific and that many people would have such
2 symptoms, thinking that they were ill for some other
3 reason. That's about the best I can say.

4 Q What were the symptoms? What were the
5 neurological symptoms? You call it a cerebral palsy-
6 type syndrome, so they must have recorded some of the
7 symptoms. Is that correct?

8 A There are many symptoms. For example, there
9 are movement-disorder symptoms. There certainly was a
10 decrease in the intelligence of the children that were
11 born. There is a general feeling of being ill. There
12 is GI upsets, and there are other symptoms, of which I
13 just don't make a point of remembering because they
14 are things that a physician would deal with if he were
15 doing the examination.

16 Q And what is the reference for those
17 symptoms?

18 A Someone coughed. I didn't hear you.

19 Q I'm sorry. What is the reference for those
20 symptoms described at Minamata?

21 A There are three or four -- there are many
22 books written by the Minamata Research Institute. If
23 you have any trouble getting one, I'll send you one,
24 if you'll e-mail me.

25 Q I'm sure I can get one. Thank you.

1 A Thank you.

2 Q Would you agree, Dr. Aposhian, that for most
3 of the period in utero that the blood brain barrier is
4 not as fully formed as it is postnatally?

5 A Yes.

6 Q You state in your report, and you discuss
7 today, Pink Disease -- correct? -- and Pink Disease
8 was a condition that resulted from the use of mercuric
9 salts. Is that correct?

10 A Mercuris, not --

11 Q Mercuris salts.

12 A In your report that I was shown, you say
13 "mercuric," but really it was exposure to mercuris.

14 Q Mercuris salts. I apologize.

15 A Now, perhaps the mercuris was converted to
16 mercuric in the body, but the exposure, the initial
17 exposure, is mercuris.

18 Q Mercuris salts. Thank you for correcting
19 me. And it was topically applied to the gums of
20 infants. Correct?

21 A It was topically applied to the gums, but
22 I'm not quite sure how much tissue is exposed when a
23 tooth is beginning to bud. A simple topical
24 application seems, to me, to be a very simple way of
25 looking at it.

1 Q You described earlier the symptoms of Pink
2 Disease, did you not?

3 A Yes.

4 Q Could you go through them again, please?

5 A Sure. Do you mind if I go back to give you
6 the exact words?

7 Q Well, if you know them off the top of your
8 head, that would be helpful, but if you want to go
9 back -- if you have a list of symptoms, that would be
10 fine.

11 SPECIAL MASTER HASTINGS: Doctor, do try to
12 speak up.

13 THE WITNESS: I'm sorry. All right.

14 Anyway -

15 SPECIAL MASTER HASTINGS: Just one moment,
16 please. Doctor, one moment here. We're going to
17 check your microphone to see if it's working
18 correctly.

19 (Pause.)

20 THE WITNESS: Here we are. Mizro babies and
21 toddlers. Bright pink or red in color, photophobic --
22 they are sensitive to light -- with raw beef hands and
23 feet, anorexic, peeling of skin, gangrene in the
24 extremities. I'm sure there are other signs and
25 symptoms, too, but those were the most important ones

1 that I thought at the time that were relevant.

2 BY MS. RENZI:

3 Q Is there any evidence of an increased rate
4 in autism in children who recovered from Pink Disease
5 as compared to the general population?

6 A I'm trying to think of the best way to
7 answer that question. We wanted to investigate that,
8 we went back over records at the time -- nothing. I
9 was contacted by people in Australia. Australia had a
10 lot of Pink Disease. Australia supposedly kept their
11 records, and when the people contacted me from
12 Australia, knowing that we were interested in autism
13 and mercury, they said they would be willing to
14 cooperate.

15 I said, I need the medical records before we
16 invest government money and come all the way out to
17 Australia to do a survey and view mercury levels in
18 you all because there is a survivor of Pink Disease
19 society in Australia. After they looked into it, they
20 could find no hospital records that would give us that
21 data.

22 And, again, in those days of Pink Disease,
23 1890 to 1950, autism wasn't even considered to be a
24 childhood disorder. I'm trying to think when the
25 psychiatrists thought of the ridiculous statement that

1 autism is caused by refrigerated mothers, and that's
2 about the time.

3 Q I don't mean to interrupt, but the answer is
4 you don't know.

5 A I don't know what?

6 Q You don't know if there was any evidence of
7 an increase in the diagnosis of autism.

8 A No one looked for it. No one looked for it.

9 Q Is there any evidence of an increased rate
10 in immunosuppression in the children who had Pink
11 Diseases compared to the general population?

12 A Again, no one looked for it.

13 Q So you don't know.

14 A No one looked for it. The absence of
15 evidence doesn't mean that there is evidence for
16 absence.

17 Q Do children with autism show signs of Pink
18 Disease?

19 A I don't think so. I've never made the claim
20 that they did.

21 Q And you use Pink Disease -- you state on
22 page 9 of your report, and you said today, that the
23 fact that the mortality of children was not 100
24 percent, this demonstrates a genetic
25 hypersusceptibility of some children to mercury. It

1 plays a significant role with respect to the nature
2 and extent of the injury. Is that correct?

3 A Yeah. One out of 500 children exposed to
4 mercuris salts in their teething powder, and the
5 Klausen article clearly states that one out of 500 got
6 Pink Disease. So why didn't the others?

7 Q Well, do you know the amount of mercuris
8 salts that were contained in any particular teething
9 powder?

10 A No.

11 Q Do you know the dose of mercuric salts that
12 were administered to any of the infants that developed
13 Pink Disease or died.

14 A No, no.

15 Q Do you know their mercury blood levels?

16 A No one ever did a mercury blood level on
17 Pink Disease that I know of. There is no published
18 report of a blood level of mercury in pinks disease.
19 As I said to you earlier, in the talk I gave this
20 morning, that established medicine was not willing to
21 admit, was not willing to agree, that Pink Disease was
22 caused by the teething powder, and it was only after
23 the government forbid the use of this teething powder
24 containing mercuris chloride that Pink Disease
25 disappeared. No one did a mercury study.

1 Q So you don't know the dose of the children
2 who received the mercuric salts but did not have
3 symptoms --

4 A Absolutely not.

5 Q -- with those who had symptoms and recovered
6 or the doses of the children who received mercuric
7 salts.

8 A I don't.

9 SPECIAL MASTER HASTINGS: Doctor, if you
10 could wait until she finishes her questions --

11 THE WITNESS: I'm sorry.

12 SPECIAL MASTER HASTINGS: -- then we can get
13 a better record.

14 THE WITNESS: Thank you.

15 BY MS. RENZI:

16 Q Do you know if there were any limitations to
17 the dose amounts the parents could administer to the
18 infants? The parents could administer the teething
19 powder any time they thought it was needed. Is that
20 correct?

21 A You'll have to repeat the question, please.

22 Q Were there any limitations on the
23 application of the mercuric salts in the teething?

24 A Not that I know of.

25 Q The parents could administer the teething

1 powder as often as they thought it was needed. Is
2 that correct?

3 A I don't know.

4 Q But isn't it true that unless you compare
5 the dosages of the mercuric salts between those
6 infants who suffered reactions and those that did not,
7 it is just mere speculation that these adverse
8 reactions were a result of genetic
9 hypersusceptibility.

10 A "Speculation" means there is no evidence for
11 a concept that one is trying to put forth. There
12 certainly is evidence that there are people
13 hypersusceptible to mercury. Whether some of these
14 children were hypersusceptible and got Pink Disease,
15 we have no evidence, one way or the other.

16 Q Doctor, I'm going to move on. Is it fair to
17 say that you have performed a significant number of
18 studies involving chelation?

19 A I have performed a number of studies on
20 chelation for the drug that is used now for the FDA-
21 approved treatment of children with lead poisoning.
22 We did all of the human metabolic studies as to what
23 happens to this drug, DMSA, in the human body, and we
24 did much of the work showing that this compound would
25 also chelate mercury.,

1 Q And you've published peer-reviewed articles
2 on chelation. Is that correct?

3 A Many of them.

4 Q Have you ever published a peer-reviewed,
5 experimental study on chelation where you did not take
6 both prechelation and postchelation urine
7 measurements?

8 A To my knowledge, we have never done that
9 because we've always insisted that we do a
10 prechelation baseline. Many of the studies that have
11 been reported just don't do a baseline, so all they
12 can say is the mercury is at this level. We've always
13 done a baseline, a prechelation plus a postchelation
14 study.

15 Q That's the way you assess the effect of the
16 chelator. Is that correct? That's the way you assess
17 the effect of the chelator. Is that correct?

18 A That is one of the ways you assess
19 chelation. That's the best way.

20 Q And without pre- and postchelation urine
21 levels, what would the study tell you?

22 A Pardon?

23 Q And without getting both prechelation urine
24 and postchelation urine levels, what would a study
25 tell you?

1 A What it could tell you is that we have a
2 vast amount of literature that tells us what the
3 normal range of human urinary mercury excretion is.
4 That normal range, we would often say, if it's above
5 15 micrograms per liter, you should see a physician.
6 Clearly, intervention is recommended.

7 So if someone is chelated, and he has 100 or
8 200 micrograms of mercury per liter, we are certainly
9 going to say, "You'd better go see a physician and
10 have this taken of," or the physician should do this,
11 and if someone calls me, I tell them, "Well, wait a
12 week or so and get a baseline again, and let's see
13 what the baseline value is." So a baseline value is
14 definitely the proper way of doing it.

15 Q You discussed today about the possible
16 adverse effects of dental amalgams. Is that correct?

17 A Yes.

18 Q And you state in your report also that the
19 average person with the average number of amalgam
20 surfaces emits and retains about 10 micrograms of
21 mercury from those amalgams. Is that correct?

22 A That's a figure that many people use.

23 Q Who is the average person?

24 A The average person is a person with the
25 average number of amalgam surfaces in his mouth?

1 Q What is the average number of amalgam
2 surfaces?

3 A It's usually considered to be about 10 in
4 this country, but other people will give you another
5 number.

6 Q Has there ever been an association between
7 dental amalgams and autism?

8 A The reason why I'm hesitating is I remember
9 reading a review article where a mention may have been
10 made and my surprise at it. So let me say that I
11 don't think there is a connection for dental amalgams.

12 Q Do you believe that dental amalgams cause
13 Alzheimer's Disease?

14 A I don't think there is enough evidence to
15 show that, one way or the other. The evidence that is
16 available is not the best.

17 Q Do you believe that dental amalgams cause
18 Parkinson's Disease?

19 A Again, I don't think the studies have been
20 good studies. Whether amalgams do or do not cause
21 Parkinson's Disease, I don't think there is enough
22 good evidence available to make a decision.

23 Q You state in your report that the
24 proposition that dental amalgams actually cause these
25 diseases is not generally accepted. Do you agree with

1 that?

2 A Yes.

3 Q And when you say "not generally accepted,"
4 do you mean in the scientific and medical communities?

5 A My I elaborate on that? All right. There
6 is a term that we use called "micromercurialism," and
7 by "micromercurialism," we mean those people who have a
8 level of mercury in them that is not excessive but
9 will cause some sort of physiological response.

10 Q Sir, I hate to interrupt, but you're not
11 answering my question.

12 A Pardon?

13 Q My question is, when you say something is
14 not generally accepted, do you mean by the scientific
15 and medical communities? I don't think that you're
16 responding to my question.

17 A Yes.

18 Q Are you aware that the U.S. Public Health
19 Service, the World Health Organization, the American
20 Dental Association, and the National Multiple
21 Sclerosis Association, among many, have determined
22 that dental amalgams pose no risk to public health?

23 A May I take some time to clarify that point?
24 On September 6th, 7th, and 8th, in a town near
25 Rockville, Maryland, a meeting was held by the FDA to

1 discuss this question. The FDA wrote a paper, which
2 is available on the Web, stating that dental amalgams
3 were not dangerous, were safe. There are no harmful
4 effects.

5 For the first time for the FDA, rather than
6 just a dental committee, they had a committee made up
7 of the Dental Committee of the FDA and the Neurology
8 Committee of the FDA. It was the first time they have
9 ever done this. The Neurology Committee were first-
10 class physicians from many medical schools. In
11 addition, they had three or four consultants that the
12 Neurology Committee asked to attend. They had
13 Klausen, who is a prime example of a first-class
14 toxicologist. They had Michael Ashwood from
15 Vanderbilt University, and they even had dentist
16 consultants.

17 That committee -- I think there were 13
18 neurology and neurology consultants and seven dentists
19 -- that committee voted 13-to-7 not to accept the FDA
20 paper that said that amalgams were safe. It was the
21 first time that's been done.

22 So we now have on record, by an FDA
23 impartial committee, the statement by the majority of
24 these two committees saying that the question is still
25 open whether amalgams are safe or not, that more work

1 has to be done. You can get this off the Web. It's
2 available. If you have any trouble getting it, I
3 would be glad to send it to you.

4 Q "More work needs to be done." Is that what
5 you said, Doctor?

6 A Certainly, more work has to be done.

7 Q But the societies I named earlier state that
8 dental amalgams pose no health risk.

9 A I'm sorry?

10 Q The societies I read to you in my last
11 question state that dental amalgams pose on public
12 health risk. I did not mention FDA.

13 A I don't understand your question.

14 Q Are you aware that the U.S. Public Health
15 Service, the World Health Organization, the American
16 Dental Association, and the National Multiple
17 Sclerosis Society have determined that dental amalgams
18 --

19 A Would you tell me the dates of those,
20 please?

21 SPECIAL MASTER HASTINGS: Doctor, please let
22 her finish the question.

23 THE WITNESS: I'm sorry. I'm sorry. I get
24 excited about this. My apology.

25 MS. RENZI: I do not have the dates.

1 THE WITNESS: I think that if you look it
2 up, you'll find that the U.S. Public Health Service
3 made that statement around 1996 or 1997 --

4 MS. RENZI: Okay. Thank you.

5 THE WITNESS: -- and that the other
6 statements -- if you ask most scientists, they are not
7 at all amazed that the American Dental Association
8 would make such a statement.

9 BY MS. RENZI:

10 Q You're currently conducting in vitro and in
11 vivo studies on the metabolism of arsenic. Correct?

12 A I think I know your question, but would you
13 say it louder?

14 Q Are you currently conducting studies, both
15 in vivo and in vitro, on the metabolism of arsenic?

16 A Yes.

17 Q What is an "in vitro study"? What is an "in
18 vitro study"?

19 A An "in vitro study" usually means that
20 you're not taking a whole organism, whole animal.
21 You're taking either cells of that organisms or you're
22 taking isolated enzymes of that organism. So it's not
23 the whole animal. "In vitro" implies it's not the
24 whole animal; it's just a part of the animal that
25 you're isolating and studying.

1 Q So, in other words, they are studies carried
2 out in isolation from a living organism. Is that
3 correct? Are they usually done on a Petri dish?

4 A No. I'm sorry.

5 Q They are not carried out in isolation?

6 A I'm sorry. I didn't mean to interrupt her.
7 The cell is indicative of a thousand other cells and
8 a million other cells in the animal. So it's not an
9 isolation of the individual.

10 Q But it's an isolation of the entire living
11 organism. Is that correct?

12 A Pardon?

13 Q It's an isolation. It's not the same as the
14 entire living organism. Is that correct?

15 A Correct. It's not like the entire organism.

16 Q And in vivo studies take place in living
17 organisms. Is that correct? In vivo studies; they
18 take place in living organisms. Is that correct?

19 A The living organism, but some people would
20 say a cell, an isolated cell, a tissue culture cell is
21 a living organism, and that's an in vitro study.

22 Q You're performing in vivo studies currently
23 on mice. Is that correct?

24 A We're, at the present time, studying methyl
25 mercury in mice, trying to get the mercury out of the

1 brain, in vivo.

2 Q Do you always expect the same results from
3 in vitro and in vivo studies?

4 A It's difficult to say. It depends on how
5 well the experiment is designed. Usually,
6 historically, in medical science and biomedical
7 science, an in vitro study will precede an in vivo
8 study because an in vitro study can be done very
9 inexpensively, whereas an in vivo study, whether it's
10 done on an animal or a human being, is very expensive
11 and more time consuming.

12 Q But you normally do both. Is that correct?

13 A We normally do both, but not all of the
14 time.

15 Q But if you would expect the same results
16 from an in vitro study as you would from an in vivo
17 study, then you wouldn't have to do both. Is that
18 correct?

19 A No, because there are always some people
20 that are, for one reason or another, either don't
21 believe an in vivo study or don't believe an in vitro
22 study. So it's just easier to do both experiments so
23 you don't have to argue at some meeting whether these
24 studies are relevant.

25 Q But you can't conclude from an in vitro

1 study what will happen in vivo. Is that correct?

2 A That's incorrect.

3 Q You can conclude from any in vitro study
4 what will happen when you perform that same experiment
5 in an entire living organism in an in vivo study.

6 A Very often, I can predict it.

7 Q Very often? How often?

8 A Ninety-five percent of the time.

9 Q Then why do you do both?

10 A Because I've told you, I'll go to a meeting,
11 I'll present an in vitro study, and someone who won't
12 know very much about the basic ways of doing
13 experiments will say, "I don't believe in vitro study.
14 It's really an isolated part of the animal," and so
15 it's just easier to say, "We've also done the in vivo
16 study," so there is no sense of arguing this and
17 taking the public's time.

18 We've done the in vitro study and the in
19 vivo study. Both studies show the same thing, or both
20 studies don't show the same thing. But most of the
21 time, in our hands, working with arsenic and mercury,
22 both studies will show the same thing, with one
23 exception, and that is when we are trying to find the
24 enzyme or the mechanism by which ethyl mercury was
25 deethylated, and methyl mercury was demethylated in

1 the brain.

2 Q Okay.

3 A Then we had to take brain slices because we
4 could not do this in the whole animal. We were
5 looking for the enzyme.

6 Q So when you do an in vitro study, you can
7 predict what will happen if you do the same study in a
8 human.

9 A Very often.

10 Q How often?

11 A I just told you, I think, about 95 percent
12 of the time, but that's because I've been doing this a
13 long time. It depends also on what kind of a study
14 you're doing.

15 Q When you do an in vivo animal study, can you
16 use that study to conclude what will happen when you
17 do the same experiment in a human being?

18 A Now, you're getting into a very difficult
19 field. You're asking whether we can extrapolate what
20 goes on in an animal with what goes on in a human
21 being, and this depends on what kind of experiment
22 you're talking about.

23 If you were to ask me, "What is the
24 effective dose of an antibiotic in a mouse as compared
25 to a human being?" it probably is quite different, so

1 you would have to do an in vivo study there. But if
2 you were to ask me whether the enzyme, alcohol
3 dehydrogenase is present in a liver slice as well as a
4 complete animal, I would say, yes, absolutely present
5 in both cases.

6 Q You said they are both present, so you know
7 that some organisms, like both a human and an animal -
8 -

9 A Yes.

10 Q -- have present a liver. Is that what
11 you're saying? If you perform an experiment on that
12 liver in the mouse and in the human, do you expect to
13 get the same results?

14 A Again, it depends on what you mean by "the
15 same result." Do we expect to find an enzyme called
16 alcohol dehydrogenase in a mouse liver and in a human
17 liver? The answer is yes. If you say, "How much
18 alcohol dehydrogenase do you expect to find in a mouse
19 liver as compared to the human liver?" I would say
20 probably different.

21 Q Well, let's talk about Attachment B of your
22 report, and I think it's an article authored by you,
23 on chelating agents. If you would like that study, we
24 can hand that to you.

25 A I don't have those pages here, I don't

1 think. I apologize for not coming better prepared and
2 bringing all of this paperwork.

3 Q That's why we have someone here to hand
4 these things to you.

5 A So what page are you talking about now?

6 Q I'm talking about Attachment B. This is the
7 article you authored on chelation, the chelation of
8 mice.

9 A It's the Aposhian article?

10 Q Yes.

11 A My dear wife has a better brain than I have.
12 I wish she were here. So what about this article?

13 Q Did you conclude from that study that the
14 chelating agents you use on mice would have the same
15 effect on humans from that one study?

16 A If you're talking about this article --

17 Q Yes.

18 A -- this is a review article. It's not an
19 experimental article. It's not a report of an
20 experiment. There may be an indication or a reference
21 to such an article, but you'll have to tell me on what
22 page you're talking about.

23 Q You're looking at Meso-2, 3, the DSM
24 article.

25 A Which one?

1 Q It's Exhibit B. Could you read the title of
2 that article? I'm sorry. Could you please read the
3 title of that article?

4 A The title is "Meso-2, 3-Dimercaptosuccinic
5 Acid: Chemical, Pharmacological, and Toxicological
6 Properties of an Orally Effective Metal Chelating
7 Agent." Is this the article you're talking about?

8 Q Yes, it is. Thank you.

9 A And is there some item in this article on a
10 page that you can tell me about?

11 Q Yes. If you could go to page 302, please.

12 A 302.

13 Q And you state in that article that "DMSA is
14 biotransformed into a mixed --"

15 A Excuse me. Could you tell me what
16 paragraph?

17 Q It is the second paragraph.

18 A The which one?

19 Q The second paragraph on page 302.

20 A Okay. Beginning, "DMSA is biotransformed"?

21 Q Yes.

22 A Okay.

23 Q And you state in that article that the DMSA
24 is biotransformed into a mixed disulfide in humans.
25 Is that correct?

1 A Yes.

2 Q You found it in humans, but that you did not
3 find it in rabbit, mouse, or rat urine. Is that
4 correct?

5 A Correct.

6 Q So there is an experiment that you performed
7 on humans and on animals where the results were
8 different. Is that correct?

9 A And it really surprised us.

10 Q Is a mouse dendritic cell the same as an
11 intact human immune system?

12 A I'm not a histologist. I really can't tell
13 you whether they are the same or not. My guess would
14 be that they are very, very similar.

15 Q A mouse dendritic cell is the same as an
16 intact immune system --

17 A As far as its function is concerned, I would
18 think that they would have a very, very similar
19 function.

20 Q So human dendritic cell is the same as an
21 intact human immune system. One cell is the same as
22 the whole system. Is that what you're saying, sir?

23 A I'm not sure I understand your question.

24 SPECIAL MASTER HASTINGS: Doctor, I think
25 you started to answer the question before, before you

1 heard the end of it.

2 THE WITNESS: I apologize.

3 SPECIAL MASTER HASTINGS: So why don't you
4 ask your question before?

5 THE WITNESS: I apologize.

6 SPECIAL MASTER HASTINGS: It's all right.

7 BY MS. RENZI:

8 Q Is a mouse dendritic cell, one mouse cell,
9 the same as an intact immune system in a human being?

10 A I don't know.

11 Q Is a human dendritic cell, the one cell, the
12 same as an intact human immune system?

13 A I don't know.

14 Q You don't know. Do you know what a
15 "dendritic cell" is?

16 A Pardon?

17 Q Do you know what a "dendritic cell" is?

18 A Yes.

19 Q What is it?

20 A It's a cell that is responsible for many of
21 the immune responses where macrophages are made and
22 come out of.

23 Q Are there many of them or few of them in the
24 human body?

25 A I'm not an expert witness in immunology. I

1 don't claim at all --

2 Q You're not an expert witness in immunology.

3 A -- to be an immunologist, and I'm
4 incompetent to answer any questions that you have
5 about immunology, as an expert immunologist would.

6 Q But you state in your report that you find
7 the in vitro studies of Gothe and Agawal highly
8 significant. Do you recall that in your report?

9 A I recall that very well.

10 Q And although you're not an immunologist,
11 what do you mean by "highly significant"?

12 A Because the concentration of thimerosal that
13 was used in that experiment was almost equal to the
14 concentration of thimerosal that you would expect in
15 the cell of a child that was exposed to a vaccination.

16 Q And would those studies be as highly
17 significant if the dose were higher than those found
18 in thimerosal-containing vaccines?

19 A I would have to think more about that.

20 Q So you believe that in vitro studies on most
21 dendritic cells and on isolated human dendritic cells
22 can be used to conclude, more likely than not, that
23 small doses of thimerosal will cause immune
24 dysfunction in the human body.

25 A Would you mind repeating the last part of

1 that sentence?

2 Q Do those in vitro studies --

3 A Could you talk into the microphone, please?

4 Q By "highly significant," do you conclude
5 that those in vitro studies tell you how thimerosal
6 will act in small doses in the human body?

7 A I think it would be an indication, it would
8 be a lead, as to what you should do next. What is
9 important is that, at that dose of thimerosal, there
10 was an effect.

11 Q So it helps form a hypothesis as to what
12 will happen in the human body. Is that correct?

13 A Yes.

14 Q Are there any studies in humans that
15 conclude that small doses of thimerosal, such as those
16 contained in thimerosal-containing vaccines, cause
17 immunosuppression?

18 A Not that I know of, but I'm not an
19 immunologist and would not be familiar with that
20 literature.

21 Q In the Agawal and Gothe studies, the
22 dendritic cells were exposed to thimerosal and not
23 ethyl mercury. Is that correct?

24 A That's correct.

25 Q Do you know whether in vitro -- I know

1 you're not an immunologist, but whether the thimerosal
2 would metabolize into ethyl mercury the same way it
3 would in the human body?

4 A I don't know the answer to the question, but
5 I would suspect that it would metabolize very quickly,
6 that the SH group would split off the ethyl mercury
7 very, very rapidly in even a dendritic cell.

8 Q That would be your guess.

9 A That would be my opinion based on what I
10 know about sulfohydro groups, disulfides bonds, and
11 the stability of such compounds and what the
12 literature says.

13 Q What literature is that?

14 A The literature by many people clearly -- I
15 think Suzuki in Japan was the first to show that
16 thimerosal, which is ethyl mercury acetal silicic
17 acid, you might say -- he showed, and confirmed by
18 Margolis and others, that the sulfur bond to the
19 benzene ring is split very, very quickly, very
20 rapidly.

21 Q Would you agree, sir, that in the human body
22 ethyl mercury binds to red blood cells, proteins, and
23 other molecules so that the entire dose of thimerosal
24 and thimerosal-containing vaccine does not come into
25 contact with the dendritic cells?

1 A I don't know, but I would be surprised if
2 they did not come in contact because what you've got
3 to understand --

4 Q I'm not asking you whether it comes into
5 contact; I'm asking you whether a portion of that
6 ethyl mercury binds to red blood cells, proteins, and
7 other molecules so that the entire dose does not come
8 into contact with the dendritic cells in the human
9 body.

10 A That's reasonable.

11 Q Do you know what percentage of ethyl mercury
12 binds to red blood cells in human beings?

13 A I would hazard a guess, but I had better
14 not.

15 Q Would it surprise you if it were 90 percent?

16 A That would not surprise me.

17 Q But in the Gothe and Agawal studies, the
18 entire amount of thimerosal is able to affect the
19 dendritic cells. There is nothing else in there for
20 the thimerosal to bind to. Is that correct? The
21 entire exposure of the thimerosal is to the dendritic
22 cell. Is that correct?

23 A Again, you'll have to get closer to your
24 microphone. I'm sorry.

25 Q When you put the thimerosal in the in vitro

1 study on the dendritic cell, there is no binding to
2 red blood cells, proteins, or other molecules. Is
3 that correct?

4 A I don't know that that is correct. I would
5 expect that there are many agents in a dendritic cell
6 to which ethyl mercury would bind.

7 Q Does the Gothe or Agawal study tell you
8 that, or are you guessing?

9 A I'm not guessing. I'm using 50 years of
10 experience in research as to the properties of a thial
11 compound and what that thial compound would react
12 with, and it would react with many, many constituents
13 in a cell.

14 Q But there is one dendritic cell, and that
15 gets the entire exposure of the thimerosal in the in
16 vitro studies performed by Gothe and Agawal. Is that
17 correct?

18 A Again, you will have to repeat the question
19 into the microphone. I'm sorry. The acoustics here
20 are terrible.

21 Q I apologize. Then would you agree that the
22 thimerosal in the Gothe and Agawal studies is exposed
23 only to the dendritic cells in the in vitro studies?

24 A Yes.

25 Q Thank you. And it is your opinion that,

1 based on those two studies, that it is more likely
2 than not that thimerosal-containing vaccines cause
3 immune suppression in humans?

4 A I think that the amount of thimerosal in
5 those experiments could cause immunosuppression.

6 Q Is it more likely than not?

7 A More likely?

8 Q More likely than not?

9 A I think it's more likely that it will cause
10 immunosuppression.

11 Q And that's based on those two studies. Is
12 that correct?

13 A I have more faith in the Agawal paper
14 because they dealt with human cells. The other paper
15 dealt with mouse cells.

16 Q Assuming that thimerosal can cause immune
17 suppression, do these studies demonstrate how long
18 that immune suppression will last?

19 A No, but papers by a Swedish group -- the
20 author's name begins with H, and I can never pronounce
21 it -- did point out that the immunosuppression lasts,
22 the statement he made was, "a lengthy period."

23 Q A lengthy period?

24 A Yes. That was what the paper said.

25 Q You didn't file that paper with your report,

1 did you, sir?

2 A I don't remember whether it's in my report
3 or not. It would be on the last page of the text. If
4 I could see that, I could tell you.

5 Q You should have your report with you, sir.

6 A No. It's not in here. But it's a very
7 well-known paper.

8 MS. RENZI: Well, if I ask Ms. Chin-Caplan
9 to supply that paper, will you supply that to her?

10 THE WITNESS: Excuse me?

11 MS. RENZI: If I ask Petitioner's counsel to
12 supply that paper, could you provide that to her?

13 THE WITNESS: Absolutely. In fact, when
14 Vera, our immunologist, comes before the Court, I
15 would suspect she will have that paper. There are two
16 or three papers by the same author.

17 BY MS. RENZI:

18 Q You said it's a lengthy period. You stated
19 that the immune suppression lasts for a lengthy
20 period.

21 A The term I remember is "lengthy."

22 Q You can't quantify.

23 A I looked in the paper for some more of a
24 statement, and in that one particular paper that I was
25 reading, I could not get a more exact description at

1 the time.

2 Q Is it your point that the ethyl mercury
3 causes a persistent immunosuppression, even after it
4 is no longer in the blood?

5 A It's complicated because ethyl mercury will
6 break down to mercuric mercury, and mercuric mercury
7 will also cause immunosuppression.

8 Q Where does ethyl mercury break down into
9 mercuric mercury?

10 A Pardon?

11 Q Does that occur in the brain, sir? Is that
12 correct? Does ethyl mercury break down into mercuric
13 mercury in the brain? Is that correct?

14 A Everywhere, in most cells. There is nothing
15 novel about the brain. What's novel about the brain
16 is the mercuric mercury cannot come out of the brain.
17 We have mercuric mercury from ethyl mercury
18 especially in the kidney.

19 Q The Swedish that you just cited to --

20 A A Scandinavian study.

21 Q Scandinavian -- I'm sorry -- Scandinavian
22 study. When you say "lengthy period," that also means
23 that, at some point, the body returns to its normal
24 immune state, that it does not last for --

25 A I'm not an immunologist, so I really wasn't

1 reading the paper looking for that. I was reading the
2 paper to see what I could learn about the properties
3 of the various species of mercury, as far as
4 immunosuppression.

5 Q But "lengthy period" would refer to a start
6 and an end, whatever that length is. Is that correct?

7 A I don't know.

8 Q Is it your belief that Michelle Cedillo
9 received thimerosal-containing vaccines that
10 suppressed her immune system prior to the receipt of
11 her MMR?

12 A It's my professional belief that thimerosal
13 probably triggered something that caused immune
14 suppression in Michelle. Thimerosal may have done it,
15 per se, but I doubt that. I think the thimerosal
16 triggered some other reaction in the body that caused
17 immunosuppression.

18 Q What is your evidence for that?

19 A The evidence would be based on, I believe,
20 some experiments that Ellen Silbergeld at Hopkins has
21 done, in which she showed the immunological properties
22 of mercury. I don't remember which species or all of
23 the species. But I think she reported it in a paper
24 given in Finland in 2002 or 2003. The paper is in the
25 press. It's published in Toxicology and Applied

1 Pharmacology.

2 I believe she refers to some experiments
3 that were done in her lab on immunosuppression caused
4 by methyl mercury species, but I don't remember the
5 details any more than that.

6 Q You don't remember the details, but you're
7 relying on that article to form your opinion that
8 there was a trigger.

9 A Because I read the paper very carefully at
10 the time, came to a conclusion, and then went on to
11 other things.

12 Q Does the amount of time between the last
13 thimerosal-containing vaccine that Michelle received
14 and the receipt of her MMR vaccination make a
15 difference as to whether she was immune suppressed?

16 A Again, I'm not an immunologist. I would not
17 want to -- I'm not an immunologist. I would not want
18 to try to speculate on what I believe, in that
19 respect.

20 Q Is there any evidence? You said you looked
21 at some of the medical record. Is that correct?

22 A Yes.

23 Q And I know you're not an immunologist, but
24 is there any evidence in the medical records that you
25 reviewed that Michelle Cedillo was immune suppressed

1 between the time of her thimerosal-containing vaccines
2 and the time she received her MMR vaccination?

3 A I'm a toxicologist. When I read an article,
4 I just think about toxicological aspects of the
5 article. If it's immunology, I usually skip over it
6 because I'm not an immunologist.

7 Q Are there any studies that show that ethyl
8 mercury in the brain can cause immune suppression?

9 A I don't know of any. There may be, but I
10 don't know of any. The concept of immunosuppression
11 and ethyl mercury is relatively new. It's not my
12 concept. I think one of the first thoughts about this
13 comes from Ellen Silbergeld at Hopkins.

14 Q You cite in your opinion to the Ashwood
15 article, and that is Attachment C to your report.
16 Would you like us to hand you that report so I can ask
17 you some questions?

18 A I remember the statement. It was a
19 statement that was made -- I'm sorry. May I?

20 Q Sure.

21 A It was a statement that was made just to
22 form a liaison with the other articles, with the other
23 reports, that were being done by the immunologists.
24 It was trying to make a connection between thimerosal
25 autism and immunology. That's the only reason that

1 was put in there. I think it's the last sentence,
2 isn't it, practically?

3 Q I'm sorry?

4 A I'm glad I'm not the only one who can't
5 hear. I think it's the last sentence, isn't it, in
6 the --

7 Q Of your report, are you referring to the
8 Ashwood article? I'm not sure of the last sentence
9 that you're referring to.

10 SPECIAL MASTER HASTINGS: You're right,
11 Doctor. It's in the last sentence of your report.

12 MS. RENZI: Of your report. I'm sorry.

13 THE WITNESS: Thank you, Special Magistrate.

14 BY MS. RENZI:

15 Q Does the Ashwood article indicate that
16 thimerosal plays a role in immune dysfunction in some
17 autistic children?

18 A I don't know. I don't think so, but I don't
19 recall.

20 Q You state on page 9 of your report that some
21 children can receive 185.5 micrograms of ethyl mercury
22 from a thimerosal-containing vaccine during the first
23 14 weeks of life. Is that correct?

24 A Just a moment, please.

25 SPECIAL MASTER HASTINGS: Where on the page,

1 Ms. Renzi?

2 MS. RENZI: I may have the wrong page.

3 SPECIAL MASTER HASTINGS: I think I see it.
4 It's under "Thimerosal and Childhood Vaccine." It's
5 the fifth line down.

6 THE WITNESS: Here it is, nine. So I have
7 this page 9 before me now, and so what question are
8 you asking about it, please?

9 BY MS. RENZI:

10 Q I was asking about the 185.5 micrograms of
11 ethyl mercury received through thimerosal-containing
12 vaccines.

13 A It says: "Some children can receive 185.5
14 micrograms of ethyl mercury from thimerosal --" that
15 sentence?

16 Q Yes.

17 A All right. What about it?

18 Q Did Michelle Cedillo receive -- how much
19 mercury? You've calculated how much ethyl mercury
20 Michelle Cedillo received. Is that correct?

21 A Yes.

22 Q Do you have that handy?

23 A Sure. Let me just refer. I want to give
24 you the exact number. On a micrograms-of-mercury-per-
25 kilogram basis, it was --

1 SPECIAL MASTER HASTINGS: Doctor, please
2 speak up a little bit. When you go down to look at
3 that, we lose you.

4 THE WITNESS: I'm sorry. The data that I
5 have with me is perhaps more relevant. It's on
6 micrograms of mercury per kilogram body weight in the
7 case of the Cedillo child, and the highest cumulative
8 dose, cumulative dose, was between about 10.7, I think
9 it is, micrograms of mercury per kilogram body weight.
10 It's in the report that was handed to you this
11 morning.

12 BY MS. RENZI:

13 Q Did you calculate that?

14 A Pardon?

15 Q Did you calculate that number?

16 A Yes. Yes, I did.

17 Q And what was it based upon? I'm sorry.
18 What was it based upon?

19 A It was based on the amount of mercury, the
20 cumulative amount of mercury, that Michelle was
21 exposed to at a certain date, and then that was
22 converted to micrograms of mercury per kilogram of
23 body weight.

24 Q Could you give me the specific numbers,
25 please?

1 A I'm trying to think of where they might be.
2 She received a total of 137.5 micrograms of mercury
3 from her vaccines. By 18 months of age, she received
4 a total of at least 137.5 micrograms of mercury from
5 her vaccines. During the first four months of her
6 life, she received 75 micrograms of mercury. Does
7 that --

8 Q My question to you is, she received a total
9 of 135 micrograms over her first 18 months of life.
10 Is that what you said?

11 A She received 137.5 micrograms of mercury
12 from thimerosal during the first 18 months of her
13 life.

14 Q And is that how much she accumulated in her
15 blood at any one time?

16 A This is what she was exposed to. This is
17 the total amount of mercury that was injected into her
18 over a unit period of time.

19 Q But if you measured her blood levels at any
20 one time --

21 A It has nothing to do with blood levels at
22 this stage. This data is what she was injected with,
23 the amount of mercury she was injected with, her
24 exposure, as we call it.

25 Q Okay. I know I'm repeating myself. If you

1 could answer yes or no, at any given time, did
2 Michelle Cedillo have 135 micrograms of ethyl mercury
3 in her body?

4 A At the day of her last vaccination, which, I
5 gather, was when she was 18 months of age, if you
6 added up all of the mercury that she had received in
7 her vaccinations up until the age of 18 months, it
8 came to 137.5 micrograms of mercury. That is what she
9 literally was injected with, was exposed to, over this
10 period of time.

11 Q You believe that autism is caused by an
12 efflux disorder. Is that correct?

13 A I believe that, first of all, autism is not
14 a single disorder. You have autistic spectrum
15 disorders. At one end of this "spectrum," as it's
16 called, is Asperger's Disease. At the other end is a
17 very severe autism.

18 Now, when a chemist looks at a spectrum, the
19 chemist looks for individual bands. This has not been
20 done with the autism spectral disorders. So the
21 autism spectral disorders are probably made up of a
22 different group of diseases with similar signs and
23 symptoms. All right?

24 Now, one of those probably is due to one of
25 these specific diseases that fall into the autism

1 spectral disorder definition is probably due to
2 children having a mercury efflux disorder.

3 Q I may not be understanding you, so correct
4 me if I'm wrong. Can you identify those children,
5 based on their symptoms or based on where they are in
6 the spectrum, whether it was caused by an efflux
7 disorder?

8 A We can, on the basis of the Adams work --
9 can you hear me all right? -- on the basis of the
10 Adams paper, which just came out in 2007, we can
11 identify those children who have more mercury in their
12 teeth than other children.

13 What we want to do eventually, and it's a
14 territorial nightmare, is to get the brain tissue of
15 deceased autistic children and to get other tissues
16 from deceased autistic children and analyze them and
17 compare them to a proper control to see if the mercury
18 level in them is excessive.

19 Q But you don't have those brain tissues. Is
20 that correct?

21 A I don't have them.

22 Q No one has done the experiments on those
23 brain tissues, so you have the tooth study. Is that
24 the basis for your conclusion that autism is caused by
25 a mercury efflux disorder?

1 A No. You've got to take into consideration
2 the hair experiment by Holmes, which was confirmed by
3 the MIT group, number one. You have to take into
4 consideration the Bradstreet experiment, which showed
5 that DMSA indicated there was a greater body burden of
6 mercury in autistic children, and you have to take
7 into consideration the Adams experiments on the teeth.

8 So when you put those together,
9 collectively, they support the idea of a mercury
10 efflux disorder. There is no question that many more
11 experiments have to be done.

12 Q You didn't mention two other studies that I
13 will mention today. One is the Ip study from 2004,
14 and the other is the Kern study from 2007. Are you
15 familiar with those studies?

16 A I'm familiar with one of the latter studies.
17 Who was the first one?

18 Q Ip, I-P.

19 A And what was that study about?

20 Q These studies failed to replicate the hair
21 study and the Holmes study.

22 A I'm not surprised because hair studies are
23 probably the most difficult studies to replicate.
24 There is no question about the fact that if hair
25 studies are not done in an experienced laboratory who

1 had experience doing them, that the values are
2 meaningless.

3 Q So it's your point that the Holmes study was
4 done right, but that the Ips study was not. Is that
5 correct?

6 A The Holmes study was done at the Doctor's
7 Data, which probably analyzes more mercury samples
8 than any other laboratory in the world. All right?
9 They have been certified, they have been approved, by
10 the FDA for doing hair analysis.

11 Q What do you know about the Kern paper?

12 A There are two, so you've got to tell me
13 which Kern paper you're talking about. Is this the
14 Sohago Group?

15 Q The 2007.

16 A Pardon?

17 Q 2007?

18 A You've got to tell the title, please.

19 Q I'll have to get it. It's the Kern hair
20 study. Is there more than one?

21 A I thought that the Kern was also the Adams
22 paper because I thought Kern was an author on the
23 Adams study. Kern, I remember, is a psychiatrist from
24 Dallas or someplace in Texas, I think, and I think
25 what they did was look at the sulfohydro groups in

1 autistic children versus nonautistic children.

2 Now, I don't think it was a very good study,
3 and when I do a quick read on the study, if I don't
4 think it's very good, I just don't bother with it
5 anymore.

6 Q Are you familiar with the Ips study?

7 A Pardon?

8 Q Ip, I-P.

9 A What about it?

10 Q Are you familiar with it?

11 A Yes. Actually, they gave me a copy of the
12 Ip paper.

13 Q And what is that study about?

14 A I think they, more or less, could not repeat
15 some results.

16 There are other papers I should tell you
17 about, in case you don't know about them, and that is
18 there is a paper that came out of Missouri which
19 claimed that autistic children did not, when given
20 DMSA, did not excrete an increase in mercury. But if
21 you quote that paper, the answer to it is almost none
22 of their subjects, normal or autistic children,
23 excreted very much, if any, mercury.

24 So my guess is that whoever did their
25 mercury analysis don't know what they are doing. This

1 is from a clinical toxicology or emergency medicine
2 group, I think, at the University of Missouri, and
3 when you look at that paper, you just have to say,
4 "Wow. How could anyone get those results?"

5 So not all scientific papers, even in peer-
6 reviewed journals, are good.

7 Is it all right if I just stand up and
8 stretch for a minute?

9 SPECIAL MASTER HASTINGS: Go ahead.

10 MS. RENZI: I'm almost done, but we can take
11 a break, if you would like to.

12 THE WITNESS: Thank you.

13 SPECIAL MASTER HASTINGS: Doctor, let me
14 take this time to apologize to you, too. Here we are
15 trying to get you to speak up, and it turns out your
16 microphone wasn't in proper working order, so I
17 apologize.

18 Go ahead, Ms. Renzi.

19 BY MS. RENZI:

20 Q Doctor, you stated earlier today that not
21 everyone who gets vaccinated gets autism. Is that
22 correct?

23 A Of course, as you know.

24 Q And you said that it's the timing that is
25 critical as to why some children develop autism, and

1 some children do not.

2 A That's what I would think.

3 Q So they have to receive an immunization
4 during a very specific window in order to develop
5 autism. Was that your testimony today?

6 A That is a possibility that, to me, seems
7 reasonable.

8 Q Is it more likely than not?

9 A Pardon?

10 Q Is it more likely than not that this theory
11 -- has this theory been proven by anyone else? I'll
12 start with that.

13 A In science, we get some experimental
14 results, or we get some data, and we try to understand
15 the data, and then when we try to understand the data,
16 we set up a hypothesis. The hypothesis eventually
17 will be proven correct or incorrect. The hypothesis
18 that I've offered is that perhaps there is a very
19 narrow window for children who are vaccinated to have
20 an effect on their developmental system and,
21 therefore, causing autism, and that some children may
22 not get vaccinated in that window, and other children
23 may. So there is a variability here, and this is a
24 hypothesis.

25 Q So, in your hypothesis, let's assume that

1 Michelle Cedillo got vaccinated at two months and one
2 day, and she developed autism following her MMR
3 vaccine. She received thimerosal-containing vaccines
4 at two months and one day, and then went on to get an
5 MMR vaccine at 15 months and developed autism.

6 A But she also got a vaccination -- I think it
7 was seven months before. I think the MMR is what, at
8 12? I've forgotten what month the MMR is given.

9 Q She received her first MMR at 15 months.

10 A At 15 months? Okay. I think she got her
11 last mercury-containing vaccination -- the MMR does
12 not have mercury in it -- probably around seven
13 months. Am I correct or not? I don't have the
14 figures in front of me.

15 Q I think you are correct about nine months
16 earlier. That is correct.

17 A So it is possible that that window, at that
18 time, was very narrow, enough to cause some kind of
19 immunosuppression.

20 Q Which window are you talking about? Is this
21 the window when she received her thimerosal-containing
22 vaccine or the window that is between the time of her
23 receipt of her thimerosal-containing vaccine and the
24 exact day she received her MMR vaccine?

25 A I have hypothesized that it is the window

1 when she received that last, seven-month dose of
2 vaccine, thimerosal-containing vaccine.

3 Q The Pichichero paper found a half life of
4 mercury in the blood of seven days. Is that correct?

5 A Of what kind of mercury?

6 Q Ethyl mercury in the blood.

7 A You're talking about when thimerosal was
8 injected.

9 Q Yes.

10 A And are you talking about the humans, or are
11 you talking about the monkeys?

12 Q I am talking about the Pichichero paper with
13 the humans.

14 A Okay. All right. Now I know what you're
15 talking about.

16 SPECIAL MASTER HASTINGS: Now which paper is
17 that, the Pichichero paper?

18 MS. RENZI: Yes.

19 SPECIAL MASTER HASTINGS: Okay.

20 THE WITNESS: What's your question? May I
21 ask?

22 BY MS. RENZI:

23 Q You said that there was a flaw with that
24 study, that you can't compare that to the autistic
25 children who receive vaccines as to the half life of

1 ethyl mercury in their blood. Is that correct?

2 A What I did say, I believe, was that autistic
3 children, if they have a mercury efflux disorder,
4 would have different toxicokinetics and that that
5 data, in normal children, may not be applicable at all
6 to a child who cannot get rid of mercury his or
7 herself.

8 Q Is there any evidence? Are there any papers
9 that confirm your hypotheses on that?

10 A I think, if you're talking about the
11 hypothesis of mercury efflux disorder?

12 Q Whether autistic children have a longer half
13 life of ethyl mercury in the blood. Are there any
14 peer-reviewed articles that state that autistic
15 children --

16 A I don't know if that's been done. I don't
17 think any mother would want more ethyl mercury
18 injected into her autistic child, knowing what has
19 happened before. So I doubt that that experiment can
20 be done in humans.

21 Q You also stated in your testimony today that
22 immune suppression is significant in the development
23 of autism. Is that correct?

24 A I think I may have said that in that figure
25 that I showed that one of the possible pathways for

1 ethyl mercury triggering something was it would first
2 trigger immune dysregulation, and this would lead to
3 immunosuppression. Again, that was a model that I had
4 up on the screen, and, again, it's a hypothesis.

5 Q Do any papers or peer-reviewed articles
6 confirm your hypothesis?

7 A The hypothesis was made less than three or
8 four weeks ago, so the answer is no.

9 Q You also stated, in your testimony today,
10 that there are genes involved in the handling of
11 mercury in the body.

12 A Yes.

13 Q Are these genes polymorphic?

14 A Yes. Let me clarify something. At the
15 present time, we only have proof for one such gene
16 that is affected by mercury. There probably are
17 others, but there is no paper published about those
18 others as yet.

19 Q Has anyone tested Michelle Cedillo for this
20 gene?

21 A There are certain rules and regulations that
22 must be followed before an academic institution or an
23 academic person can do something with a human,
24 especially a child. I would not be surprised if those
25 experiments have been done at the University of

1 Washington, but, at the present time, I don't know
2 whether they have or not.

3 A study was published in 2005, two years
4 ago, maybe a year and a half ago. Those studies, in
5 order to get through a human subjects committee, it
6 would take a while. But I would be amazed if those
7 studies are not ongoing at the present time.

8 Q So could any of the 5,000 children that now
9 have claims before this Court get that genetic test,
10 be identified with that gene, and then we could
11 determine that that particular person's autism was
12 caused by the handling of the mercury due to that gene
13 defect?

14 A First of all, one must realize, there are
15 many genes involved with mercury toxicity. There are
16 different genes that convert elemental mercury to
17 mercuric mercury. There are different genes that
18 convert ethyl mercury to mercuric mercury.

19 Let's say Autistic Child X has a faulty gene
20 that will cause a different porphyrin-urine profile.
21 It's another case to be able to prove that the defect
22 in that gene causes autism. Just because a child has
23 it, and a normal child doesn't, doesn't mean that that
24 is the cause.

25 What has to be done, believe it or not, when

1 you talk about in vitro experiments, what has been
2 done with other diseases in similar genes is you take
3 that gene and put it into a yeast, and the yeast --
4 you can reproduce many of the effects that you find in
5 a human being by a gene. You can produce many of the
6 transport efflux disorders found in humans in the
7 yeast cell, which still amazes me, but it's true.

8 Q Now, you stated earlier that, even if there
9 is a genetic susceptibility in autistic children to
10 retain mercury, does every child who has autism have
11 that efflux disorder?

12 A As I said earlier, we have autism spectrum
13 disorder, a group of diseases, and I don't think any
14 physician that I know of would say that the autism
15 spectrum disorder diseases are just one disease or one
16 disorder. There is Asperger's. Do you know what
17 Asperger's is?

18 Q Yes, I do.

19 A Okay. These are the infant savant, very
20 unusually gifted children. So these are very, very
21 gifted children, and then we have the very, very
22 severe autism children at the other end. In between,
23 we have all sorts of variations. So one cannot say
24 that all of these autism kids have the same disorder,
25 the same genetic disorder at this stage of the game.

1 Q Is there any way you can determine whether a
2 child has this genetic susceptibility to autism?

3 A There are papers about his, actually, one
4 from Rutgers. There is an excellent review article on
5 the genetics of autism from the Mass. General
6 Hospital. I know you're down here in Washington, but
7 Mass. General and Harvard Hospitals are considered to
8 be the meccas of American medicine, as Hopkins is.

9 There is a very good review article that
10 came out two or three, maybe two years ago. It was so
11 good that I stopped and sent an e-mail to someone I
12 didn't even know saying what a wonderful article it
13 was, and she was shocked to receive such compliments,
14 and I was shocked that I gave it, too.

15 Q Now, did you cite it in your report?

16 A Pardon?

17 Q Did you cite that article in your report?

18 A No, because I didn't see any need of citing
19 that article at the time. It was just a review.

20 Q But it talks about genetic susceptibility.
21 It's an excellent article about genetic susceptibility
22 in autism.

23 A That was an article pointing out the theory
24 of the month, as far as which gene causes autism. We
25 really don't have any specific data, but there is one

1 paper coming out of Rutgers that is highly thought of.
2 I don't remember the names of the authors or even
3 what they did.

4 MS. RENZI: I have no further questions.
5 Thank you, Doctor.

6 THE WITNESS: Thank you. I'm sorry that I
7 interrupted you when you were asking questions.

8 MS. RENZI: And I'm sorry if I interrupted
9 you, sir.

10 SPECIAL MASTER HASTINGS: Let's take a
11 restroom break at this time, and we'll be back in 15
12 minutes.

13 (Whereupon, a short recess was taken.)

14 SPECIAL MASTER HASTINGS: All right, folks.
15 We'll be starting again here if everyone will take
16 their positions.

17 Dr. Aposhian, you're still in the hot seat,
18 I'm afraid.

19 THE WITNESS: Still?

20 SPECIAL MASTER HASTINGS: We have maybe a
21 couple of questions for you here, and if you would
22 take the witness stand again, hopefully, we'll get you
23 through it soon.

24 THE WITNESS: Thank you, sir.

25 SPECIAL MASTER HASTINGS: Thank you very

1 much. Just for the benefit of those individuals who
2 are listening in here or are here in person and have
3 not witnessed a hearing in the Vaccine Act, I note
4 that it is quite common -- it's basically the rule in
5 these cases that the special master, generally after
6 both parties have asked questions of the witness, the
7 special master often does ask questions. I have one
8 or two for Dr. Aposhian myself, and I'm going to be
9 asking my colleagues if they have any, so this is not
10 an unusual practice.

11 I meant to say, this morning, that the three
12 of us have spent many, many, many hours, weeks, and
13 months, actually, studying the medical literature that
14 you've heard Dr. Aposhian talk about, and you'll hear
15 many witnesses talk about.

16 There are many hundreds of articles put in
17 about 18 or 19 expert reports. We've studied all of
18 those, and we've done our best to learn as much as we
19 can ahead of this trial so we can understand what the
20 experts are talking about, and sometimes, in the
21 course of doing that, we come up with some questions
22 that we would like to hear the witnesses answer.

23 Now, it turns out, as in most cases, as was
24 the case today, both the fine counsel for both sides
25 have already asked most of the questions that I had

1 for Dr. Aposhian, but a couple of more were raised
2 today, so I'll go ahead and ask those, and then we'll
3 give the Petitioners' counsel a chance to ask any more
4 redirect questions of Dr. Aposhian.

5 Doctor, one thing I was interested in: You
6 mentioned, just toward the end of your testimony,
7 talking about what was referred to as the "window of
8 vulnerability," and you were describing that as a
9 hypothesis and that it's plausible based on everything
10 you know.

11 I guess what I'm asking is for you to tell
12 us, as best you can, how sure you are of that. Is it
13 something you're absolutely sure about, or is it just
14 sort of an initial hypothesis? Is it something you
15 can say you think it's probably correct? Can you help
16 me on that?

17 THE WITNESS: Sir, if I were able to do the
18 experiments, I know what experiments I would do, and
19 so let me say that, at the present time, it is an
20 initial hypothesis. It is an initial hypothesis,
21 based on what we know about other toxic agents and the
22 windows that they act in, the very narrow windows.
23 The idea of a narrow window made sense to me because
24 of the question: Why don't all children who got
25 vaccinated get autism?

1 The answer to your question, I hope will
2 satisfy you, is that this is an initial hypothesis.

3 SPECIAL MASTER HASTINGS: All right. Let me
4 ask the same question about your general view. You
5 testified here today, in great detail, about the
6 effects of mercury in its many forms, and you
7 suggested that another hypothesis you have is that the
8 thimeric to mercury in the form of thimerosal can
9 cause immune suppression in these individuals and that
10 thereby, I guess, ultimately leading to their autism.

11 The theory that I understand you're talking
12 about is immune suppression, that mercury causes
13 immune suppression. Again, is that a hypothesis? How
14 strongly can you support that?

15 THE WITNESS: It is not my hypothesis
16 originally. There may have been other people, but the
17 paper that I know is a paper by Ellen Silbergeld, who
18 is a professor at Hopkins. She is a McArthur Fellow,
19 which is a "genius award," if you will. She is the
20 only toxicologist that ever received the McArthur
21 "genius award," and, knowing her, I have a great deal
22 of confidence in her papers, and there is a paper that
23 she published that was the result of a talk she gave
24 at the International Congress of Toxicology in
25 Finland, which, I think, was about four years ago,

1 2002, I think.

2 So I have a great deal of confidence that
3 there is immunosuppression caused by ethyl mercury,
4 based on the work of others. Is there anything else?

5 SPECIAL MASTER HASTINGS: All right. So you
6 say "a great deal of confidence."

7 THE WITNESS: Yes.

8 SPECIAL MASTER HASTINGS: Do you think it's
9 probable?

10 THE WITNESS: It's very plausible, in my
11 opinion, very, very plausible.

12 SPECIAL MASTER HASTINGS: Can I follow that
13 up? When you say "very plausible," can you go so far
14 as to say "probable"?

15 THE WITNESS: I thought "probable" was less,
16 but I think it was probable. Highly probable.

17 SPECIAL MASTER HASTINGS: All right.

18 THE WITNESS: I believe it happens.

19 SPECIAL MASTER HASTINGS: That answers my
20 question. That's all the questions I have for this
21 witness. Special Master Vowell?

22 SPECIAL MASTER VOWELL: Yes. I have a
23 couple of clarification questions, Dr. Aposhian. You
24 referred earlier in direct examination to a Mexico
25 study and they you referred in cross-examination

1 specifically to a New Mexico study. Is there one
2 study or are there two studies?

3 THE WITNESS: There are two entirely
4 different studies.

5 SPECIAL MASTER VOWELL: Okay.

6 THE WITNESS: Would you like me to define
7 what they --

8 SPECIAL MASTER VOWELL: Please explain the
9 difference to me.

10 THE WITNESS: Okay. The New Mexico study
11 involved the pig, who drank a bottle of methyl mercury
12 and the family in rural New Mexico slaughtered that
13 pig within a couple of days and that pig was fed to
14 children and the rest of the family. The children got
15 ill, very ill. I think one of them died. Another one
16 lived until -- for another 20 or 21 years. And that
17 one that lived for 20-21 years, when they autopsied
18 her, they did a brain mercury analysis and they found
19 her brain mercury, which would be inorganic mercury,
20 was 100 times above normal. So, that's the New Mexico
21 study.

22 The Mexico study is one that my group did --
23 I don't remember what it was. In Mexico, we were
24 called in to determine the following. There was a
25 lotion, a cosmetic lotion that was used to lighten the

1 skin, to bleach the skin of people with dark skin.

2 And this contained --

3 SPECIAL MASTER VOWELL: Calomel?

4 THE WITNESS: Pardon?

5 SPECIAL MASTER VOWELL: Calomel?

6 THE WITNESS: I don't remember --

7 SPECIAL MASTER VOWELL: Or mercurous

8 mercury.

9 THE WITNESS: There are a number of names of
10 it. Anyway --

11 SPECIAL MASTER VOWELL: Mercurous chloride?

12 THE WITNESS: -- we were called in to
13 examine the fact there were workers, who made it, and
14 a number of people, including a 90-year old
15 grandmother, who had -- great grandmother, who had put
16 it on her skin for years. And we gave them a
17 chelating agent to determine their body burden. We
18 had -- we did a baseline on them and then gave a
19 chelating agent. So, the Mexico study that we did was
20 to determine how much mercury, what was the body
21 burden of mercury in these workers and people, who had
22 been exposed to a lotion that contained mercurous
23 mercury, actually. Does that clarify your question?

24 SPECIAL MASTER VOWELL: Yes. And I -- did
25 you cite both of those studies in your report, do you

1 recall?

2 THE WITNESS: I don't think I -- I'm not
3 certain whether I cited the Mexico study. It may not
4 have been relevant. It would be -- if we did, it
5 would be in the bibliography. The first author is
6 Gonzalez.

7 SPECIAL MASTER VOWELL: Okay. There is an
8 article in your bibliography, and I want to make sure
9 that I'm not confusing --

10 THE WITNESS: No.

11 SPECIAL MASTER VOWELL: -- your testimony in
12 the studies. It's at Tab GG of your attachments.
13 Could I prevail upon the Department of Justice
14 paralegal to hand that to Dr. Aposhian, please? It's
15 a study by McRill and Boyer from 2000 and it involves
16 Arizona in a cosmetic claim. Are you talking about a
17 similar study you did?

18 THE WITNESS: Oh, I know this paper.

19 SPECIAL MASTER VOWELL: Okay.

20 THE WITNESS: Let me -- would you like me to
21 explain that paper?

22 SPECIAL MASTER VOWELL: No. I think I
23 understand the paper, Dr. Aposhian. I just wanted to
24 make sure that you were referring to a study you were
25 involved in, not this particular one.

1 THE WITNESS: Our paper is not this paper.
2 Our paper is a different one. This is a -- I think it
3 appeared in the Journal of Emergency Medical. Ours
4 appeared, I think it was in the Journal of
5 Pharmacology and Experimental Therapeutics.

6 SPECIAL MASTER VOWELL: Did you come up with
7 any different results than this study?

8 THE WITNESS: Yes.

9 SPECIAL MASTER VOWELL: Okay.

10 THE WITNESS: We were amazed to find out how
11 much mercury was in some of these people. We had --
12 until some of the figures were given to me today, we
13 were amazed at the milligram amounts of mercury that
14 we found in some of these people. And they were
15 exposed to both elemental mercury in the synthesis of
16 the mercurous mercury compound and the assembly of the
17 lotion with the mercurous mercury.

18 SPECIAL MASTER VOWELL: Okay. And my second
19 question has to do with page nine of your report. And
20 at page nine, in the first paragraph, you talk about
21 the mortality rate from Pink disease as being between
22 5.5 and 33-1/3 percent.

23 THE WITNESS: Yes.

24 SPECIAL MASTER VOWELL: Can you tell me
25 where those figures came from? The article you cite,

1 the Dally article, doesn't contain those figures and I
2 am just trying to find out whether that is something
3 commonly known to toxicologists.

4 THE WITNESS: I believe it went into one of
5 Clarkson's review articles. Clarkson is one of the
6 senior, probably the most experienced mercury
7 investigator before he retired. He retired about four
8 or five years ago. And he's written maybe probably
9 four or five review articles since he's retired. And
10 I think in one of those papers, that figure is given.
11 That's why I say, certainly the figure 1/500th is
12 from one of his articles.

13 SPECIAL MASTER VOWELL: I did find that one.
14 I'm sorry, I just didn't find the other one and I was
15 hoping you could --

16 THE WITNESS: When I get back to my lab, can
17 I send it to you?

18 SPECIAL MASTER VOWELL: Certainly send it to
19 counsel for Petitioners and they will file it with us,
20 I'm confident. Those are all the questions I have,
21 Dr. Aposhian. Thank you, very much.

22 THE WITNESS: Thank you.

23 SPECIAL MASTER HASTINGS: Special Maser
24 Campbell-Smith, did you have any questions?

25 SPECIAL MASTER CAMPBELL-SMITH: No questions

1 at this time.

2 SPECIAL MASTER HASTINGS: All right. That's
3 all the questions we have. Ms. Chin-Caplan, did you
4 have any redirect?

5 MS. CHIN-CAPLAN: No redirect.

6 SPECIAL MASTER HASTINGS: All right. I
7 understand from our discussion earlier that you would
8 -- you were next going to go with the testimony of
9 Theresa Cedillo. And before you come up over here,
10 Dr. Aposhian, you are off the hot seat, at this point.
11 We thank you, very much.

12 (Witness excused.)

13 SPECIAL MASTER HASTINGS: While both of you
14 are here, earlier today, as we started the hearing, I
15 made some remarks of thanks about your family and
16 thanks and you were out of the room with Michelle at
17 that point. So, I just wanted to perhaps reiterate
18 those and say to both of you, as I said this morning,
19 that we certainly, the three of us here and all the
20 members of the Court, are very grateful for the fact
21 that your family was willing to have Michelle's case
22 designated as the first test case in the Omnibus
23 Proceeding. We thank you and all the members of your
24 family, which, as we mentioned this morning, for
25 coming here to be with us today. And we, also, wanted

1 to say that certainly having read all of the medical
2 records of what you folks have gone through with
3 Michelle, we wanted to extend our sympathy to you
4 folks, but also to say that we certainly feel a lot of
5 admiration for the way you've dealt with Michelle,
6 with her illness and taking care of her. And we
7 enjoyed meeting you here this morning before we
8 started and we thank you, very much, your whole
9 family, for your participation --

10 Mrs. Cedillo: Thank you, very much.

11 SPECIAL MASTER HASTINGS: -- today and
12 throughout the rest. So with that, Mrs. Cedillo, as a
13 reward, we are going to grill you. So, if you would
14 come and take a seat.

15 Whereupon,

16 THERESA CEDILLO,
17 having been first duly sworn, was called as a witness
18 herein and was examined and testified as follows:

19 SPECIAL MASTER HASTINGS: Please have a seat
20 and Ms. Chin-Caplan, go ahead, please.

21 MS. CHIN-CAPLAN: Thank you, very much.

22 DIRECT EXAMINATION

23 BY MS. CHIN-CAPLAN:

24 Q Could you kindly state your full name for
25 the record, please?

- 1 A Okay. My name is Theresa Cedillo.
- 2 Q And are you married?
- 3 A Yes, I am.
- 4 Q And what is your husband's name?
- 5 A My husband's name is Michael.
- 6 Q Do you have any children?
- 7 A Yes, I have one child, Michelle.
- 8 Q And is Michelle the subject of this hearing
9 today?
- 10 A Yes, she is.
- 11 Q Can you describe to the Court what Michelle
12 was like when she was first born?
- 13 A Michelle was a happy, robust baby, very
14 loving.
- 15 Q And was she responsive to you and your
16 family members?
- 17 A Very responsive, very normal, very happy, a
18 good baby.
- 19 Q When you say 'very normal,' what do you mean
20 by that?
- 21 A She -- well, starting from birth, you know,
22 I breast fed her. She breast fed normally.
23 Everything about her was normal, her sleeping habits,
24 her play habits. She became very -- she had a lot of
25 attention to grandparents, my husband, myself, being

1 the only child. So, she was very responsive to all of
2 us.

3 Q And as Michelle grew older, did you take her
4 for regularly scheduled doctor appointments?

5 A Yes, I did.

6 Q At these doctor appointments, did any of the
7 pediatricians indicate that they thought that Michelle
8 was not developing normally?

9 A No, they did not.

10 Q At some point in time -- well, prior to
11 that, can you tell the Court when Michelle sat up?

12 A Michelle sat up -- unassisted, you're asking
13 me? Unassisted, probably about seven or eight months.

14 Q And was she -- can you tell the Court when
15 she started to babble?

16 A She started to babble close to -- well,
17 actually earlier than that. I'm going to say
18 approximately -- well, ask me again. Just baby babble
19 or closer towards just babble in general?

20 Q Yes.

21 A She made happy sounds very young, maybe
22 three and four months, like the cooing sounds.

23 Q And did she smile at you --

24 A Yes.

25 Q -- and your husband?

1 A Yes, she did.

2 Q Did she, at some point in time, start to
3 develop words?

4 A Yes, she did.

5 Q And what words did -- was Michelle able to
6 say?

7 A Well, she was able to say, baby, mommy or
8 mama, daddy, addy was daddy, juice, apple -- I'm
9 probably leaving some out -- words supposed to be
10 kitty versus key; turtle was turt-turt, like that.
11 And she said Jesus, because my mom had shown her a
12 crucifix in her house everyday, she said, Jesus loves
13 you, there's Jesus, and she'd go Jesus, and a few
14 other words.

15 Q But, you understood what she was saying to
16 you?

17 A Oh, yes.

18 Q Did Michelle play with toys --

19 A Yes.

20 Q -- when she was younger?

21 A Yes, she did.

22 Q And did she react when other people came
23 into the homes?

24 A Yes, she did.

25 Q Did she play with other children?

1 A Yes, she did.

2 Q And about the time of Christmas 1995, when
3 she was about 15 months old, can you tell the Court
4 what Michelle was able to do at that time?

5 A At that time, she was beginning to walk. I
6 can't recall exactly at the 15-month point if she was
7 walking completely independently. But, she could push
8 the little baby shopping cart unassisted. She played
9 with her toys. She played with us. She interacted
10 with all of us, her family. We took her everywhere.
11 Like I said, being the only grandchild in town, my mom
12 and I, we went to lunch with her -- I mean, we took
13 her to lunch with us. She went to church with us, to
14 the park, to the grocery store. You know, she was on
15 regular outings, to visit family and family
16 gatherings. She was happy. She ate normal. Her
17 health was normal, you know. And she was a happy,
18 well baby.

19 Q Now prior to December 20, 1995, had Michelle
20 received all of her immunizations as scheduled?

21 A Yes, she did.

22 Q And on December 20, 1995, did Michelle
23 receive another immunization?

24 A Yes, she did.

25 Q What immunization did she receive?

1 A The measles-mumps-rubella vaccination.

2 Q Can you describe to the Court what Michelle
3 was like after she received the MMR?

4 A Six days -- for the six days following the
5 vaccination, she was okay. On the seventh day, she
6 developed a fever that lasted approximately four to
7 five days, that would spike up to 105 or over and then
8 come back down with Tylenol and then go back up, come
9 back down.

10 Q And when she spiked the fever, did you call
11 the doctor's office?

12 A Yes, I did. I called the doctor's office
13 and also the ER when it continued on into the weekend.

14 Q And what did they tell you?

15 A They told me there was a very bad flu going
16 around, a lot of babies were in that were sick. If
17 she had any symptoms of vomiting, which she did, it
18 was probably the flu. It was probably -- just treat
19 her with Tylenol and cool baths and keep her hydrated.

20 Q Now, you indicated that you called both your
21 doctor's office and the ER. Who told you that there
22 was a bad flu going around?

23 A They both did. The first call was to the
24 doctor's office and I don't know if I remember the day
25 of the week correctly, but I think it was like a

1 Wednesday or Thursday. But then by Friday night, I
2 could see that the fever was not coming down, so then
3 I called the ER real quick and she said, oh, honey,
4 you're better off treating her at home. We have a
5 roomful of kids here and you're just going to expose
6 her and, you know, just go ahead and treat her with
7 Tylenol and cool baths and fluids again.

8 Q So, aside from the fever, was Michelle
9 exhibiting any other symptoms?

10 A Well, she was vomiting. She was crying.
11 She was very hot with the fever. We had -- just had
12 her -- it was December, but in Yuma, Arizona, our
13 winters are like everyone else's summer or spring.
14 But, we just had her either with no little shirt or
15 just like the little baby undershirt. We had to work
16 pretty hard to keep her happy during those times. She
17 was very irritable.

18 Q So, at some point in time did the fever come
19 down?

20 A Yes, it did, about, I think, the 31st, which
21 was, I think, on a Sunday. I think that was the last
22 day of the fever.

23 Q And what happened after the 31st?

24 A After the 31st, she was -- she did not have
25 any fever for two to three days and then the fever

1 returned on either the third or fourth day, around
2 that time frame.

3 Q And what did you do when the fever returned?

4 A I called the doctor's office and made an
5 appointment. I can't remember if I made the
6 appointment or I just went in, but I -- the next day.

7 But, I had an appointment within the next one or two
8 days. I did call, though.

9 Q And when you took her to the doctor's
10 office, what did they tell you was wrong with
11 Michelle?

12 A They were unsure, except for they thought it
13 was probably like a sinusitis or viral, like the flu.
14 They noted -- I had just given her Tylenol, but her
15 fever was still, I think, 100.3 or 100.7, in that
16 range. And I had told them she was very irritable and
17 I thought she was sick. So, they thought it was
18 sinusitis or the flu.

19 Q And did they order something for Michelle?

20 A They ordered antibiotics and fluids, for me
21 to give her fluids.

22 Q So, did that fever go away, as well?

23 A Yes, it did. I think that day was the last
24 day of the fever.

25 Q After that fever, that second fever, what

1 was Michelle like?

2 A She was very irritable. She cried easily.
3 She vomited frequently, many times a day, and up to
4 where we had a little bucket and everything in a
5 couple of other rooms where she was at, because we was
6 always having -- I mean, it was so frequent, we were
7 cleaning it all day. She didn't want to eat anything
8 by mouth and she just wanted to drink a lot of fluids.
9 She -- I thought she was still have effects from the
10 flu or whatever it was that I thought she had -- or
11 they thought she had.

12 Q So, how long did the vomiting last this
13 time?

14 A The vomiting lasted quite a while. It
15 lasted, I believe, about six to eight weeks, not --
16 the frequency was greater at the beginning and then it
17 decreased, but she was still vomiting.

18 Q So, you say that she vomited six to eight
19 weeks. How many times a day would she vomit?

20 A At the beginning, it was a lot. It was like
21 maybe eight times a day and then the frequency
22 decreased. But, it was still frequent, like maybe two
23 to four times a day.

24 SPECIAL MASTER HASTINGS: Mrs. Cedillo, we
25 want to make sure that the people listening can get

1 this. So, if you can get maybe a little closer to the
2 microphone --

3 THE WITNESS: Okay, sure.

4 SPECIAL MASTER HASTINGS: -- that would be
5 great.

6 THE WITNESS: Here we go. Okay. Let me
7 just move it forward.

8 SPECIAL MASTER HASTINGS: Thank you, very
9 much.

10 THE WITNESS: Okay.

11 BY MS. CHIN-CAPLAN:

12 Q Did you notify anybody about the vomiting?

13 A I did. I called the doctor's office and
14 they thought it was just kind of like a leftover
15 thing, at the beginning, from the fever -- or from the
16 flu, I mean. And then after that, they really didn't
17 have an answer why. They thought maybe she was
18 allergic to milk or maybe I needed to change her diet.
19 But, she wasn't eating my mouth. So, there was
20 really no conclusion made.

21 Q Was Michelle eating at this time?

22 A No, she was only drinking liquids at that
23 time.

24 Q No solid food?

25 A No solid food.

1 Q Around this time, was Michelle exhibiting
2 any other gastrointestinal problems?

3 A She began having diarrhea, which we thought
4 was because she was only drinking fluids. But, we
5 didn't know, even -- we just didn't know. She was --
6 the vomiting and diarrhea.

7 Q And you said she started to have diarrhea.
8 Can you date approximately when the diarrhea began?

9 A Around the time of the fever, which is what
10 originally led us to believe it was the flu.

11 Q When you say 'the fever,' are you referring
12 to the first fever or the second fever?

13 A The first fever.

14 Q So sometime within the time frame of
15 December 27th --

16 A Twenty-seventh.

17 Q -- through the 31st?

18 A Yes.

19 Q That's when the diarrhea started?

20 A Yes.

21 Q And during this time frame immediately
22 afterwards, did the diarrhea persist?

23 A Yes, it did.

24 Q Now, when you say 'diarrhea,' are you
25 referring to the frequency of her stools?

1 A To the consistency and the frequency, both.

2 Q Okay. How many times a day did Michelle
3 have diarrhea?

4 A Thinking back, it was frequent, maybe four
5 to six times a day, she would have a stool, watery
6 stool.

7 Q And did that stop at any point?

8 A It did stop at some point, yes.

9 Q And did she develop any other
10 gastrointestinal symptoms?

11 A She did. She became constipated.

12 Q So once the diarrhea stopped, she developed
13 constipation?

14 A Yes.

15 Q And do you know approximately when that
16 occurred?

17 A It would a rough approximate. I can't
18 exactly remember. But, it was probably, if you go
19 from the 27th, maybe eight to 12 weeks after, maybe
20 more like the 12-week mark.

21 Q So, she had diarrhea for approximately eight
22 to 12 weeks after the first fever; is that it?

23 A Yes.

24 Q And then after the eight to 12 weeks had
25 passed, her diarrhea turned into constipation?

1 A Yes.

2 Q And did you notify her doctors about that?

3 A Yes, I did.

4 Q And what did they tell you?

5 A They didn't have any conclusion. Well, when
6 I did notify them, it was at a well baby check and
7 they said I could try getting her, I think it was
8 Babylax or mineral oil, I think was the name of the
9 product -- I mean, the Babylax name. Mineral oil is
10 just mineral oil.

11 Q And was that for the constipation?

12 A That was for the constipation, yes.

13 Q Now, after the high fever disappeared the
14 second time, what was Michelle like behaviorally?

15 A She was different. She seemed withdrawn. I
16 thought her hearing had been affected. She was no
17 longer talking. In fact, she was completely quiet.
18 She didn't make any sound, which is why we thought it
19 was her hearing. We thought maybe she couldn't hear,
20 so that's why she wasn't responding or making her own
21 sounds. She pushed away, when previously we could
22 hold her. She would either push away with two hands
23 or just lean away from us. We had difficulty taking
24 her out anywhere. Over time, you know, we quite
25 taking her to church or we still tried to take her for

1 stroller rides, that kind of thing. But, it was hard
2 for her to be in public settings.

3 Q So, were you able to take her to church any
4 longer?

5 A No -- well, not without causing a commotion.
6 We tried.

7 Q Were you able to take her out to lunch with
8 your mother any longer?

9 A We tried. We made several attempts; but,
10 no, eventually, we stopped. It was too upsetting for
11 everybody, for her, for the people in the restaurant,
12 for us. So, we stopped.

13 Q Now, you mentioned that prior to the MMR
14 immunization, Theresa was playing with people?

15 A Yes.

16 Q Did that continue after the high fevers
17 ended?

18 A No; no, it did not.

19 Q Did Theresa play with her toys?

20 A Michelle. You said, 'Theresa.' It's okay.
21 Michelle no longer -- Michelle was not playing. She
22 was -- she had her toys, but she wasn't playing with
23 them the same.

24 Q What do you mean by that?

25 A She would want to line them up or instead of

1 -- if it was something with like a push button, she
2 would rather study it than push the buttons. You
3 know, she wouldn't push the buttons any longer. She
4 seemed to be preoccupied with certain toys and lining
5 them up a certain way, instead of just sitting down
6 and playing with them like she did before.

7 Q Did she respond to her name when you called
8 her?

9 A No.

10 Q Did you tell your doctor that Michelle
11 wasn't responding to her name when you called her?

12 A Yes, I did.

13 Q Did you tell your doctors that she was
14 lining up her toys and that she had not done that
15 before the high fevers?

16 A I can't remember if it told them about the
17 toys until a much later time, because it seemed -- it
18 seemed unusual, but at the time, I didn't realize it
19 was the symptom of anything. So, my main focus always
20 was on that she had quit talking.

21 Q And did you tell your doctors that Michelle
22 wasn't talking any longer?

23 A Yes, I did.

24 Q And what did they tell you?

25 A They told me that sometimes, sometimes

1 children will do that, sometimes an only child will go
2 through a phase and not -- you know, and then regain -
3 - not regain, but resume, resume speaking later. They
4 said she looked okay; you know, was she bumping into
5 walls, could she still pick up things, in which she
6 could. But -- so, they said at a later time, we can
7 test her hearing, if we wanted to. But, they thought
8 she would be okay.

9 Q So, did they have any recommendations for
10 you at all?

11 A Other than a later hearing test, no.

12 Q And did Michelle, at some point, have a
13 hearing test done?

14 A Yes, she did.

15 Q And what was the results of that hearing
16 test?

17 A She had to -- one was just the regular
18 hearing test, where you're in the closed room and they
19 tried to mark her response. And it was normal. What
20 they measured was normal. It was hard, because she
21 wasn't talking. The other one was a brain step
22 auditory evoked response test and that was to see
23 whether or not the brain is processing the sound
24 properly and that was normal.

25 Q And when was that done?

1 A The brain stem test was probably done in
2 1997, maybe late 1997. It was after we -- it was
3 probably around that time, after she was diagnosed.

4 Q Now, you indicated that you told your
5 doctors about these behaviors of Michelle's, that she
6 wasn't responding to her name, that she was lining up
7 her toys, and she couldn't speak. How long did that
8 continue before you decided that you needed to see
9 somebody?

10 A That continued for probably about until
11 April of 1997, so maybe about a year's -- a year's
12 time or how long will they go back -- from the fever,
13 then it was over a year. It was probably a year and
14 three months.

15 Q And what were you doing in that one-year
16 period when Michelle was exhibiting these behaviors?

17 A I would ask other family members or other
18 friends that I knew that had only children, you know,
19 did your child talk late and somebody would give you a
20 book on the late talking child. And there was -- I
21 think that was around that time frame, I spoke to
22 other doctors. One was a friend of mine, who is also
23 a surgeon and she said she didn't talk until she was
24 five. Michelle would probably be okay. So, you know,
25 I tried to reassure myself that everything was okay.

1 And so, but at some point, you know, then it was like
2 I don't think everything is okay.

3 Q And when did you decide that you needed to
4 seek more medical care?

5 A It was following a pediatric visit for a
6 diaper rash, a real severe diaper rash that she had
7 and I inquired with that pediatrician, you know,
8 Michelle never started talking again and she had these
9 fevers and she doesn't really seem the same. So, then
10 she made a referral for me.

11 Q And who did she make the referral to?

12 A To a neurologist, who was an adult
13 neurologist.

14 Q An adult neurologist?

15 A Yuma is small, so we don't have a lot of
16 pediatric specialists, especially back then. I think
17 now, we have a couple. But back then, we did not.
18 So, some of the adults would do consults.

19 Q And did you see this adult neurologist?

20 A Yes, we did.

21 Q What did he say to you?

22 A He said that he thought -- he thought she
23 had some form of auditory problem.

24 Q And was that the reason that the hearing
25 test was done?

1 A Actually, no. The hearing test was done
2 later, at the recommendation of another doctor.

3 Q Okay. So, he thought she had an auditory
4 problem?

5 A I don't believe he even ordered a hearing --
6 an auditory test. I think we had that done on our own
7 later. But, he thought it was possibly auditory
8 based. She was not responsive to her name, not
9 responding normally.

10 Q And did he make any recommendations?

11 A He -- I think -- I can't remember for
12 certain what he recommended, other than that he was
13 thinking it was an auditory problem.

14 Q And did you seek further medical care?

15 A Yes, we did.

16 Q And who did you see next?

17 A We saw a child psychologist.

18 Q And who was that?

19 A That was Dr. Karlsson Roth.

20 Q And what did Dr. Roth tell you?

21 A She had told us that Michelle -- she
22 diagnosed her with autism.

23 Q At that time that Michelle was diagnosed as
24 autistic, did you know what that was?

25 A Vaguely, not in-depth. I knew a little bit

1 about what it was.

2 Q Did Dr. Roth tell you what Michelle's future
3 would be?

4 A She did. She said that although she was
5 very young, she was still -- still two almost three.
6 She said that at some point, she would be
7 uncontrollable, probably not too far from the age she
8 was now, and that one of our -- and that probably one
9 of our only options would be to institutionalize her.

10 Q And when Dr. Roth told you that, what did
11 you -- did you and your husband have a discussion?

12 A After probably three days of not being able
13 to speak, because we were completely overwhelmed and
14 devastated by hearing that, especially being so
15 little, then we did talk about it and we both agreed
16 that we didn't ever want to do that. We didn't ever
17 want to put her away somewhere and both decided that
18 we would try to concentrate on finding out what was
19 wrong and more about what her diagnosis was and to see
20 what form of help we could get for her.

21 Q Did you seek other medical care?

22 A Yes, we did.

23 Q And where did you go?

24 A We went to -- shortly after the diagnosis
25 the same year in 1997, it was August, we went to UC-

1 Irvine, to see Dr. Sudhir Gupta.

2 Q What was the reason you went to see Dr.
3 Gupta?

4 A Because, I had read -- I read on-line about
5 another mother, Cindy Goldenberg, who had a similar
6 situation as Michelle, and her son received IVIG
7 treatment and he got better. So, we went -- you know,
8 I found out where he was and it was in driving
9 distance and I said, oh, maybe we can see him and he
10 can tell us something.

11 Q When you say within driving distance, how
12 far away was he?

13 A He's in UC-Irvine, so it's Orange County, so
14 it's about a five- to six-hour one-way drive. That's
15 about 12 hours -- 10 to 12 hours round trip.

16 Q That's drivable?

17 A That's drivable, yes. It was drivable for
18 us, right.

19 Q So after Dr. Gupta saw Michelle, was she a
20 candidate for IVIG?

21 A Not under the -- no, she wasn't.

22 Q And after you saw Dr. Gupta, did you seek
23 other medical care?

24 A We did. He actually referred us to a
25 pediatric neurologist.

1 Q And who was that?

2 A That was Dr. Ira Lott.

3 Q And where was Dr. Lott located?

4 A He is, also, at UC-Irvine.

5 Q Okay. And when you saw Dr. Lott, did he
6 tell you what he thought Michelle's diagnosis was?

7 A Yes, he did. He had diagnosed her as
8 moderate severe autism.

9 Q And did he recommend any treatment?

10 A He recommended applied behavioral analysis
11 and any early intervention programs that we could get
12 in town.

13 Q Were you able to get BA therapy for
14 Michelle?

15 A Not at that time, we were not. We didn't
16 have any therapist or any agencies in town that
17 provided. So, it was quite a while before we got to
18 that point.

19 Q And when you say 'quite a while,' how long
20 was it before Michelle started receiving this therapy?

21 A Probably about two years, maybe one to two
22 years.

23 Q After you saw Dr. Lott?

24 A After we saw Dr. Lott, right.

25 Q Now, Dr. Lott is a pediatric neurologist; is

1 that true?

2 A Yes.

3 Q Now, you testified earlier that Michelle had
4 had diarrhea for approximately eight to 12 weeks after
5 the first fever and then it turned to constipation.

6 A Yes.

7 Q Did Michelle continue to have GI problems?

8 A Yes, she did.

9 Q And do those GI problems persist to this
10 very day?

11 A Yes, they do.

12 Q When Michelle has GI problems, what types of
13 symptoms does she manifest?

14 A They've changed over time, because, now,
15 she's somewhat partially better. But, she displays by
16 her behaviors abdominal pain, lower abdominal pain,
17 discomfort. She sometimes -- well, actually, it's
18 just abdominal. Sometimes, she'll hit herself,
19 because she's very -- has a lot of pain or very
20 uncomfortable. Or she'll stay awake until she passes
21 a stool, which could be 18 or 20 hours. I mean, you
22 know, and then she'll pass a stool and go right to
23 sleep and then we know that -- over time, we've
24 learned that that's why she keeps staying awake, even
25 though she looks like she'd nod off and go to sleep.

1 So --

2 Q You indicated that Michelle would hit
3 herself when she was having pain?

4 A Yes.

5 Q Any particular spot that she would hit
6 herself?

7 A It's changed. She used to first hit herself
8 on her thighs and her chest. Now, she hits herself
9 more on her face.

10 Q And did that behavior continue?

11 A Yes, it did.

12 Q Now, you indicated also that Michelle had
13 sleep problems?

14 A Yes.

15 Q Could you tell the Court what the sleep
16 problems consisted of?

17 A She would be awake for many hours, maybe 18
18 hours straight and then maybe sleep for two to three
19 hours and then wake up and then stay up. Sometimes,
20 she would sleep for eight hours straight. It was very
21 erratic. There was no pattern. She had a lot of,
22 while you would stay night waking, but, sometimes, she
23 would sleep in the day. But, she would just wake up
24 frequently while sleeping.

25 Q With all Michelle's problems, did you try to

1 find medical help for her?

2 A Yes, I did.

3 Q After Dr. Lott, who did you see?

4 A After Dr. Lott, I believe that's when we had
5 the BAER, the brain stem auditory evoked response, if
6 I said that in the right order. And then, we tried to
7 get an MRI, but we couldn't, because they couldn't
8 sedate her with the chlorohydrate. They weren't able
9 to get her to drink it and the suppository didn't
10 work. So, after those two visits, then we -- I read
11 on-line about a study in Phoenix, which is driving
12 distance, just three hours one-way, six hours round
13 trip, because that's around the time all the news had
14 come out about secretin and some of the kids stomach
15 problems felt better and some of their behaviors got
16 better and a few other children had completely seemed
17 to get better all the way. So, we made arrangements
18 to be evaluated and then we had her enrolled in the
19 study.

20 Q So, Michelle was accepted into the study?

21 A Yes.

22 Q And as part of the acceptance into the
23 study, was she required to undergo any diagnostic
24 procedures?

25 A Yes, she was. She was evaluated by a

1 pediatric gastroenterologist and it was his -- part of
2 his treatment plan and diagnosis was to do an upper GI
3 endoscopy.

4 Q And did he tell you why he thought Michelle
5 needed an upper GI?

6 A He said because of her behaviors, she had a
7 lot of saliva that she would either spit on her hands
8 or either lick her hands or lick everything, bath
9 books mostly, lick her hands. She would always -- you
10 know, that was one of the signs. She would hit her
11 chest and then she still had diarrhea. Well, at that
12 point, she has -- was having diarrhea, had gone from
13 constipation to diarrhea again. So, those were the
14 three.

15 Q So, based on those symptoms, Dr. -- who was
16 the doctor?

17 A Dr. Montez.

18 Q He indicated that Michelle would require an
19 upper GI for diagnostic purposes?

20 A Yes.

21 Q And was that performed?

22 A Yes, it was.

23 Q And do you know what the results of that
24 upper GI was?

25 A Yes, I do.

1 Q What were the results?

2 A She had a grade three ulcerated esophagus,
3 meaning there were ulcers for nearly the entire length
4 of the esophagus.

5 Q Throughout the entire length of the
6 esophagus?

7 A Just about.

8 Q And did Dr. Montez indicated to you whether
9 the ulcers that he saw in Michelle was any indication
10 of the symptoms that she was exhibiting?

11 A He said that he thought that that's why she
12 was hitting her chest, because it was a very -- it is
13 a very painful condition. He actually diagnosed her
14 with GERD, which gastroesophageal reflux disease and
15 he said that it's very painful. And by the time that
16 she was diagnosed, the ulcers were very bad. The next
17 stage -- well, one of the other doctors said the next
18 stage was forming strictures, which is like scar
19 tissue from the ulcers, which would then mean that it
20 would start to close. So, it was -- then, it would
21 have to be surgically opened. So, it was all a very
22 painful condition for her to happen. So, he
23 attributed her hitting her chest and crying and waking
24 to the pain that she was having from that.

25 Q And did Dr. Montez order any treatment for

1 Michelle?

2 A Yes, he did. He ordered her to be treated
3 with Prilosec.

4 Q To your knowledge, did the Prilosec work?

5 A Yes, it did; to my knowledge, yes.

6 Q And after that, after the Prilosec, did
7 Michelle undergo another diagnostic procedure with Dr.
8 Montez?

9 A Yes, she did.

10 Q And do you know approximately when that
11 occurred?

12 A That would be December 2000.

13 Q And December 2000, you said?

14 A Yes.

15 Q And do you know what the results of that
16 diagnostic procedure was?

17 A That showed that the ulcers -- the esophagus
18 had healed. She still had gastritis. She still had
19 GERD, but the medication had healed the ulcers.

20 Q And did Dr. Montez recommend any other
21 treatment for Michelle?

22 A At that time, no, he did not.

23 Q And those were her GI problems, is that
24 true?

25 A Yes.

1 Q Now, you indicated that Michelle had to go
2 for diagnostic work-up to enter the secretin study; is
3 that true?

4 A Yes.

5 Q Did you ever find out whether Michelle was
6 actually -- actually received secretin?

7 A I did find out.

8 Q You did find out?

9 A Uh-huh.

10 Q And had she?

11 A No, she had not.

12 Q So, she received placebo?

13 A Yes.

14 Q Mrs. Cedillo, did Michelle's GI symptoms
15 continue after the second endoscopy by Dr. Montez?

16 A The upper seemed resolved, but she still had
17 diarrhea.

18 Q So because she had continued diarrhea, was
19 another procedure done?

20 A Yes.

21 Q And when was that procedure done?

22 A That was done on January 31, 2002.

23 Q And do you know what the results of that
24 study was?

25 A That was an upper and lower endoscopy-

1 colonoscopy that showed that the ulcers were still
2 healed, but she still had gastritis ad she had
3 lymphoid nodular hyperglagia. And I believe his
4 diagnosis was colitis. But, I'm not sure what else he
5 found, other than, you know, the lymphoid nodular
6 hyperglagia.

7 Q Aside from the secretin study, did you try
8 to find other medical care for Michelle?

9 A Yes, I did.

10 Q And what did you do?

11 A We had -- we paid to have the ABA people
12 come in and train us on how to work with Michelle, so
13 we could try to teach her self-help skills. We had
14 speech therapy. We tried to get occupational therapy,
15 but we didn't have one in town. Then, when we got
16 one, there is a waiting list. The other -- let's see,
17 I tried to enroll her in a few early intervention
18 programs. She was almost too old by that age, because
19 I think she was about five years old by then. Early
20 intervention, I think, is three to five.

21 Q And at some point in time, did you start
22 doing some research on the Internet to look for
23 explanations about what Michelle's condition was
24 about?

25 A Yes, I did.

1 Q And in your searches, what did you find?

2 A On the Autism Research Institute website, I
3 found that they had a good bit of doctors, referred to
4 as DAN doctors, which is defeat autism now doctors,
5 and that they held conferences and that they were --
6 at that time, they were almost always in San Diego,
7 which is, again, driving distance, two-and-a-half
8 hours one-way. So, we -- and that was a whole
9 conference of nothing but doctors dealing with
10 children with similar symptoms as what Michelle had.

11 Q And did you attend one of these conferences?

12 A Yes, I did.

13 Q Which conference was it?

14 A We attended many, but this one was -- this
15 would have been in late 2002, I think it was October
16 2002, where we attended -- we attended several, but --

17 Q And at these conferences, did you learn
18 anything about what could be the cause of Michelle's
19 symptoms?

20 A I heard several presentations by several
21 doctors describing Michelle to a tee with her -- the
22 regression, her bowel problems, how her bowel problems
23 had persisted and what was wrong.

24 Q And did these presentations indicate that
25 there was potential treatment for Michelle's symptoms?

1 A Yes.

2 Q And were they particular individuals, who
3 you sought the attention of after these conferences?

4 A Yes, I did.

5 Q Whose attention did you seek?

6 A There was two actually in 2001 at that
7 conference. It was Dr. Andrew Wakefield. And later
8 in 2002, it was Dr. Arthur Krigsman.

9 Q And did you go up to speak to both of these
10 doctors?

11 A Yes. After they spoke, I approached them
12 both -- well, I mean, at different times, but at their
13 -- each of their conferences.

14 Q Now, you indicated that when Michelle's
15 bowel symptoms persisted, that she underwent another
16 endoscopy with Dr. Montez. And this would be the
17 third endoscopy with Dr. Montez, is that it?

18 A Yes.

19 Q And was that both an upper and a lower GI?

20 A Yes, it was.

21 Q When Dr. Montez did the lower GI, did he
22 also do a biopsy of Michelle's gut tissue?

23 A Yes, he did. He did two sets of biopsies.

24 Q And do you know where those biopsies went?

25 A One went to the pathology department at the

1 hospital and the other set was sent to Ireland to Dr.
2 John O'Leary's lab.

3 Q And did you get the results of that biopsy
4 from the Irish lab?

5 A Yes, we did.

6 Q And do you know what those results were?

7 A Yes, I do.

8 Q And what were they?

9 A She tested positive for measles virus RNA in
10 her colon tissue.

11 Q When you got this information, what did you
12 do with it?

13 A Well, I was overwhelmed again, because it
14 was confirming -- confirming to us what we thought we
15 had seen in her. I faxed it over to Dr. Montez and
16 asked him, you know, if there was anything we could do
17 to help her.

18 Q And what did Dr. Montez say to you?

19 A He said that he did not think there was an
20 antiviral treatment for measles virus of this type, at
21 that -- I mean, for measles virus at this time. And
22 he said that we could try similar medication to what
23 they were using in England, which was Pentasa, which
24 he ordered, of course, Pentasa for her.

25 Q And was Michelle able to tolerate the

1 Pentasa?

2 A No, she wasn't -- she wasn't able to swallow
3 the capsules, so she was getting the beads -- there
4 are beads in the capsules, so we were putting it in
5 her food. But, it's not delivered the way it is
6 supposed to be when you take it that way. It needs to
7 go in the capsule and then dissolve in the stomach and
8 she just couldn't swallow the capsules.

9 Q So, at some point in time, did you just stop
10 with Pentasa?

11 A She couldn't tolerate it probably because
12 she -- it wasn't -- she wasn't taking it the proper
13 way. So, it was probably both things, she wasn't
14 taking it the proper way and then she probably could
15 not tolerate it. She had other symptoms. She didn't
16 look well and was vomiting.

17 Q So, she was -- the vomiting had resumed
18 again?

19 A Yes.

20 Q And approximately when did the vomiting
21 resume?

22 A Approximately in late 2001.

23 Q And at that time, was Michelle continuing to
24 have diarrhea?

25 A Yes.

1 Q So, she was vomiting and she had diarrhea?

2 A Yes.

3 Q Was she able to tolerate any foods at all?

4 A Very little, very select -- she was very
5 self-limiting to what she would eat. And she would go
6 maybe three days without eating and then eat a lot in
7 one day and then not eat and like that, that pattern.

8 Q Now, you indicated that you had spoken to
9 Dr. Krigsman?

10 A Yes.

11 Q Who is Dr. Krigsman?

12 A He's a pediatric gastroenterologist in New
13 York.

14 Q And how did you find Dr. Krigsman?

15 A When I heard him speak at the DAN
16 conference, which would have been in October of 2002.

17 Q And at some point in time, did you contact
18 Dr. Krigsman after the meeting?

19 A Yes, I did.

20 Q And what was the purpose of contacting Dr.
21 Krigsman?

22 A Because Michelle was not getting any better.
23 She -- the diarrhea was a ridiculous amount and she
24 would eat and have a stool and drink and have a stool
25 and, you know, it was like she wasn't keeping anything

1 in. So, my purpose was to see if there was anything
2 that could be done to help her.

3 Q So, essentially, whatever went out, just ran
4 right out again?

5 A Sometimes immediately. If not, then it was
6 maybe within an hour or so.

7 Q And did Dr. Krigsman agree to see Michelle?

8 A Yes, he did.

9 Q And as part of -- did you have an
10 understanding of what Dr. Krigsman wanted to do when
11 he saw Michelle?

12 A Yes, I did.

13 Q And what was your understanding?

14 A My understanding is that it would require a
15 lab work-up prior to her going to see him and then
16 upper and lower endoscopy-colonoscopy.

17 Q And did you have that lab work done?

18 A Yes, we did.

19 Q Was it done locally?

20 A Yes, it was.

21 Q And do you know what that lab work consisted
22 of?

23 A Not all of it. I don't remember. He looked
24 for markers of inflammation, the set rate or ESR.
25 Like a CVC, the chemistry, I think, is what measures

1 the albumin and the protein in her body. I believe he
2 looked for markers of Crohn's disease and/or
3 inflammatory bowel disease. I don't know if there's a
4 differentiation on that.

5 Q Was this done all before Michelle went to
6 see him?

7 A I think it was. I'm not certain. It might
8 have been -- I can't remember. I think it was done
9 prior to us seeing him.

10 Q Now, at some point in time, did Michelle
11 develop some black and blue marks on her body?

12 A Yes, she did.

13 Q And did you have those evaluated?

14 A Yes, we did.

15 Q And did anybody tell you what the cause of
16 those black and blue marks were?

17 A Yes, they did.

18 Q And what was the cause of it?

19 A That she was malnourished and had developed
20 a secondary coagulating disorder.

21 Q From the malnutrition?

22 A Yes.

23 Q Now, Mrs. Cedillo, at one point in time, was
24 Michelle hospitalized because she was unable to eat?

25 A Yes, she was.

1 Q And approximately when was that?

2 A There were two times. One was May of 2003
3 and then again in late July of 2003.

4 Q In late July of 2003. During one of these
5 hospitalizations, did Michelle develop additional
6 problems?

7 A Yes, she did.

8 Q Could you tell the Court what other problems
9 Michelle developed?

10 A She, at one point, after being in the
11 hospital maybe one week, she seemed to have lost her
12 vision. And when we -- and we went completely by
13 behaviors, but we noticed that she was letting her
14 videotape run to where it was all snow, which she
15 never did. And then we would reverse it and she would
16 just want to hear the sound. She wasn't looking at
17 it. She actually had it covered up with a towel and
18 then when we would do this motion in front of her hand
19 or like this, she wouldn't flinch. And a few times,
20 she would -- she was doing this movement, like she
21 couldn't see at all.

22 Q And you were the ones, who noticed this?

23 A It was my husband and myself, my mom, my
24 aunt --

25 Q Okay. And --

1 A -- and my father.

2 Q And you told the doctors about this?

3 A I did. And she had -- also, her eyes looked
4 real dry, like the eyeball, itself, was very dry.

5 Q And did the doctors order a consult?

6 A They did. Again, she was in the hospital
7 locally and we didn't have any local pediatric
8 ophthalmologists, but they ordered a consult with an
9 adult ophthalmologist.

10 Q And do you know what the evaluation by the
11 adult ophthalmologist was?

12 A He was uncertain, but he said she did not
13 need to be on antibiotic drugs. He said she did need
14 to be evaluated. The hospital that we have didn't
15 have the ophthalmology equipment for him to do a full
16 evaluation there at the hospital, so his only option,
17 other than just looking, you know, like we're looking
18 at each other, was to -- he didn't have an equipment,
19 so we would have to take her into his office, which we
20 couldn't do, because she was hospitalized at the time.
21 So, he recommended that we stop all the antibiotic
22 drops and begin with re-wetting drops, which we did.

23 Q And did he indicate to you that she should
24 be followed-up further?

25 A Yes; yes, he did.

1 Q And did you make an appointment to have that
2 followed-up after she was discharged from the
3 hospital?

4 A Yes; at that point, we did, yes.

5 Q And who did you see?

6 A We saw Dr. Henry O'Halloran.

7 Q And where is Dr. O'Halloran?

8 A I'm sorry?

9 Q Where is Dr. O'Halloran?

10 A Oh, Dr. O'Halloran is at San Diego
11 Children's Hospital.

12 Q And how did you find Dr. O'Halloran?

13 A He was the closest eye specialist. I looked
14 on their website under pediatric ophthalmology and --

15 Q And, again --

16 A -- that was the one we could get into the
17 soonest.

18 Q And, again, San Diego Children's is roughly
19 --

20 A They're about close to three hours one-way,
21 one-way drive.

22 Q Now, when you went to see Dr. O'Halloran,
23 was it?

24 A Yes.

25 Q What did he tell you about Michelle's eyes?

1 A At that point, he said she had paling in the
2 optic nerve, but he thought, at that point, that she
3 had good potential to continue to see. But, she
4 needed to be continued to be rechecked and he --
5 because he was guessing, because he hadn't seen her in
6 the hospital, that she probably had had uveitis.

7 Q That she had what?

8 A Uveitis.

9 Q And did he indicate to you what the cause of
10 the uveitis was?

11 A Secondary to inflammatory bowel disease.

12 Q And did Dr. O'Halloran order any treatment
13 for Michelle, for her uveitis?

14 A At that point, no, he did not. He said by
15 treating her bowel disease, you will be treating the
16 eyes.

17 Q Okay. Now, when Michelle was hospitalized
18 during this time frame and you noticed that she was
19 not able to see, did she develop any other problems?

20 A She -- towards -- well, she was unable to
21 eat, so they had to place a feeding tube during that
22 time. And she lost a large amount of weight. And
23 she, also, developed arthritis; but, at the time, we
24 didn't realize it was arthritis until a later time.
25 She had swelling -- I guess you could say she

1 developed swelling in her ankle, the one ankle.

2 Q Did the swelling just remain in her ankles?

3 A Yes, it did. It was very -- it was very
4 limited at the beginning, then it got worse.

5 Q And when it got worse, what do you mean by
6 that?

7 A Once she was released and then back at home,
8 it swelled. Like in a month's time, it swelled -- her
9 legs swelled up to her knee. So from her toes on the
10 left foot all the way up to her knee on the left leg,
11 she was swelling big.

12 Q And did you seek treatment for that?

13 A We did. We couldn't get in though until
14 about a couple of months later.

15 Q How much later?

16 A A couple of months later. Well, let's see,
17 that was the end of September, so -- October, November
18 -- it was like two-and-a-half months later, December
19 2003.

20 Q And who did she see in December 2003?

21 A We saw Robert Sheets, who is a pediatric
22 rheumatologist at San Diego Children's Hospital.

23 Q And what did Dr. Sheets tell you about
24 Michelle's ankle swelling?

25 A He felt that it was arthritis secondary to

1 inflammatory bowel disease.

2 Q Mrs. Cedillo, when Michelle was hospitalized
3 for the dehydration, where was she hospitalized?

4 A In Yuma.

5 Q And did you attempt to have her transferred
6 anywhere?

7 A Yes, I did.

8 Q And where did you try to get her transferred
9 to?

10 A To Phoenix Children's Hospital.

11 Q And what happened when you tried to transfer
12 her?

13 A The doctor refused to have her transferred.
14 The ER doctor was trying to get her transferred, but
15 the doctor they were trying to transfer her to did not
16 want to have her sent there.

17 Q So, by December 2003, Michelle had a
18 diagnosis of autism. She had a diagnosis of
19 inflammatory bowel disease. She had a diagnosis of
20 uveitis. And she had a diagnosis of arthritis.

21 A Yes.

22 Q And did anybody tell you whether those
23 problems were all connected?

24 A Well, separately, all the specialists said
25 that they were connected to the bowel disease.

1 Q They were -- I'm sorry, I didn't hear you.

2 A I mean, each specialist that we saw -- I
3 mean like for the rheumatology and for the eyes, they
4 told me those were connected to her bowel disease.
5 So, does that answer? Okay.

6 Q So after Michelle started seeing the
7 rheumatology people and the ophthalmology people at
8 the University of San Diego, is that right?

9 A San Diego Children's.

10 Q San Diego Children's, did she develop any
11 other medical problems?

12 A She did. About -- well, let's see, well,
13 she developed seizures.

14 Q And could you tell the Court how those
15 seizures first began?

16 A They first began, she had only one that we
17 thought was related to Demerol, which would have been
18 in 2004, and then she didn't have another one for a
19 long period of time, until early 2005. And I'm kind
20 of approximating on the dates here. When I say
21 'early,' probably within the first three months or so.
22 And then she had what we weren't sure if they were
23 seizures, and I'm still not sure to this day, it
24 looked like she was staring, but she would still blink
25 her eyes if you went like this. But, then it would go

1 away. But then later she started having what would be
2 termed grand mal seizures.

3 Q Now, you indicated that you thought at first
4 it was reaction to Demerol?

5 A She had one seizure following IV
6 administration of Demerol.

7 Q And what was the reason she had to get IV
8 Demerol?

9 A She was in the hospital to be treated for
10 pancreatitis.

11 Q And when did the pancreatitis began?

12 A That began in early -- well, let's see. In
13 early 2004.

14 Q And what was the cause of the pancreatitis?

15 A At the time, they thought it was related to
16 her medication.

17 Q And what medication was that?

18 A 6-mercaptopurine.

19 Q And what was she on the 6-mercaptopurine
20 for?

21 A To treat her bowel disease, bowel
22 inflammation.

23 Q So the treatment that she was given for her
24 inflammatory bowel disease caused her to develop
25 pancreatitis, is that true?

1 A Yes.

2 Q And when she was in the hospital for the
3 pancreatitis, she was undergoing a procedure; was that
4 it?

5 A No, she was having pain.

6 Q She was having pain?

7 A They said that she was allowed so much pain
8 medication; did I want them to give her something?
9 Because they couldn't judge what her pain level was,
10 so they were depending on us to tell them what her
11 pain level was.

12 Q So the IV Demerol was for the pain that she
13 was having from the pancreatitis.

14 A From the pancreatitis, yes.

15 Q And the thinking was that she developed a
16 seizure disorder from the Demerol?

17 A No, they think that was an isolated
18 incident.

19 Q Did she subsequently see a neurologist for
20 these seizures?

21 A Yes, she did.

22 Q When was the first neurologist that she saw?

23 A The first neurologist -- okay, other than
24 Dr. Masland when she was real little, and I feel like
25 I'm leaving somebody out -- I think the first

1 neurologist was a consult with an adult neurologist,
2 which would have been October 1st, 2005; because of
3 that day, she had a grand mal seizure and fell and
4 broke her leg.

5 So up until then, her seizures, she wasn't
6 having that many. They were pretty far apart; maybe
7 months apart, and I wasn't certain that it was really
8 a seizure that I was seeing. So after she had the
9 grand mal seizure and fell, then I knew that they were
10 actually seizures. So they did a consult with that
11 neurologist, who placed her on medication. So that
12 was Dr. O'Malley. That was his name.

13 Q Did you say that she had a seizure, fell,
14 and broke her leg?

15 A Yes.

16 Q And when she saw the neurologist, what did
17 he say?

18 A Well, that was when they did the consult.
19 He said we needed to get her on medication.

20 Q And was she placed on medication?

21 A Yes.

22 Q What medication was she placed on?

23 A Topomax.

24 Q Did she stay on the Topomax?

25 A Yes, she did.

1 Q Did it control her seizures?

2 A Yes, it did, for awhile.

3 Q At some point in time, did the Topomax get
4 discontinued?

5 A Yes, it did. We ended up seeing another
6 neurologist before it got discontinued. So that would
7 have been Dr. Allen Kaplan at Phoenix Children's
8 Hospital.

9 Q Was he a pediatric neurologist?

10 A Yes.

11 Q And what did Dr. Kaplan recommend?

12 A What did he recommend?

13 Q Yes.

14 A He recommended to continue with the Topomax
15 at that time. Later, he was also the one who
16 discontinued it. Wait a minute; you know what, that's
17 not right. He did recommend to discontinue it. But
18 he thought that they were under control, and that she
19 wouldn't need that much medication. He said let her
20 go a little while and see how she does without it.

21 Q How did she do?

22 A She did bad. She started having seizures
23 with more and more frequency, and then she began
24 having them almost every other day.

25 Q Did you continue with Dr. Kaplan?

1 A No, we went to see a neurologist at San
2 Diego Children's Hospital.

3 Q Three hours away.

4 A Three hours away, yes.

5 Q You indicated that she had a seizure, fell
6 and broke her leg.

7 A Yes.

8 Q Did anybody indicate to you what why she
9 would break her leg just by falling?

10 A Well, she had osteopenia.

11 Q And what is osteopenia?

12 A Osteopenia is not osteoporosis; as in, it's
13 not a progressive disease like osteoporosis is. But
14 it is an indication that your bones are not as dense
15 as they should be for her age. So it's osteopenia
16 versus osteoporosis, which would be like an older
17 person with a progressively worsening disease. But
18 it's still a serious problem.

19 Q Did they tell you what the cause of the
20 osteopenia was?

21 A They said it was probably from malnutrition
22 and from steroid therapy or prednisone therapy.

23 Q What was the prednisone therapy for?

24 A That was to treat the bowel disease and the
25 arthritis.

1 Q So if I understand correctly, Mrs. Cedillo,
2 Michelle's bowel problems required that she be placed
3 on prednisone and 6MP. Is that what you told us?

4 A Yes.

5 Q And as a result of the prednisone, she
6 developed osteopenia?

7 A And the malnutrition, also.

8 Q And the malnutrition?

9 A Yes.

10 Q When she had a seizure, she fractured her
11 leg --

12 A Yes.

13 Q -- because of the osteopenia?

14 A Yes.

15 Q The 6MP that she was also receiving for her
16 bowel disease, it cause a pancreatitis?

17 A At the time, that was the conclusion, that
18 it was --

19 Q Because she had pancreatitis, she had to get
20 IV Demerol for the pain?

21 A Yes.

22 Q And it was initially thought that the
23 seizures that she developed were related to the
24 Demerol that she received?

25 A That first one, yes.

1 Q So when you took her to San Diego Children's
2 Hospital for pediatric neurology consult, what did
3 they tell you?

4 A She said that Michelle had epilepsy, which I
5 believe there's a distinction between just seizure
6 disorder and epilepsy. I believe epilepsy is worse.
7 I could be wrong. I don't know all the terms exactly.
8 She said that Michelle had developed epilepsy because
9 of everything going on with her body.

10 We already had the MRI, and her brain showed
11 to be normal. So it wasn't like she had a structural
12 problem causing the seizures. So she said it's
13 everything else -- that's her words -- everything else
14 that she has going on combined to where she has
15 developed epilepsy.

16 Q Did the doctor at San Diego Children's order
17 any treatment for Michelle's seizures?

18 A She ordered Keppra.

19 Q Is Keppra an anti-convulsant medication?

20 A Yes, it is.

21 Q What is Michelle's current dosage of Keppra?

22 A She's on 2000 milligrams a day of Keppra.

23 Q Does it control her seizures?

24 A Not completely, no.

25 Q So she continues to have seizures, this

1 present day?

2 A Yes, she does.

3 Q Approximately how often does she have
4 seizures?

5 A About two times a months; about every two to
6 three weeks.

7 Q When she has these seizures, do you give her
8 additional medication?

9 A We can give her Valium, a two milligram
10 dose, if she -- she's never done this yet, and I hope
11 she never does. But if she develops a seizure pattern
12 where she can't stop seizing, we can give her 20
13 milligrams of Valium to stop the seizure as an
14 emergency treatment.

15 Q How do you care for Michelle?

16 A She requires a lot of care. It's around the
17 clock care with, if you want to call it, two people on
18 at one time. Because somebody has to watch her all
19 the time, and then the other person is getting
20 medication ready, or if she needs to be changed, her
21 diaper changes, those kind of things, it takes two
22 people.

23 Q You indicated earlier that Michelle had a
24 feeding tube inserted; is that it?

25 A Yes.

1 Q To this present day, is she continuing to be
2 fed with a feeding tube?

3 A Yes, she is.

4 Q Does she take anything by mouth?

5 A She eats gluten and casing-free crackers and
6 water by mouth.

7 Q And nothing else?

8 A No, nothing else.

9 Q So Mrs. Cedillo, if I'm clear, Michelle
10 currently suffers from autism; and with her autism
11 symptoms, does she continue to hit herself?

12 A Yes, she does.

13 Q And where does she hit herself right now?

14 A Now she hits herself on her face.

15 SPECIAL MASTER HASTINGS: Mrs. Cedillo, can
16 you talk a little bit louder?

17 THE WITNESS: Yes, let me move this.

18 SPECIAL MASTER HASTINGS: Thank you.

19 THE WITNESS: Which one is the one that's
20 on? There's two here. Are they both on?

21 SPECIAL MASTER HASTINGS: I believe they
22 both are

23 THE WITNESS: Okay, is that better?

24 SPECIAL MASTER HASTINGS: I believe so;
25 thank you.

1 THE WITNESS: You're welcome. Okay, she
2 hits herself on her face.

3 BY MS. CHIN-CAPLAN:

4 Q Is it any particular spot on her face?

5 A Usually, it's right in here, on the eye
6 socket area; sometimes right here, in between;
7 sometimes on her chin.

8 Q Has anybody indicated to you why she hits
9 herself?

10 A It's likely due to pain. She also, in 2006,
11 was diagnosed with a 90 percent optic nerve damage.
12 Again, with uveitis and open angled glaucoma, both of
13 those things and especially the uveitis can cause eye
14 pain and pain to the eye socket area.

15 But that is now being treated, and she still
16 hits that area. So I'm not sure if she still has
17 symptoms, or if that is caused from pain from other
18 areas. But it is this behavioral thing to keep
19 hitting in this area. I'm uncertain. I don't know.
20 It can also cause headaches; uveitis can cause
21 headaches.

22 Q Now earlier you had indicated that you were
23 told that the UVA was related to the her bowel
24 disease. Are the current eye problems that she had
25 also related to her bowel disease?

1 A They believe it's related to chronic
2 inflammation from the bowel disease.

3 Q So she's autistic. Her behaviors continue,
4 and she hits herself on her forehead and in around the
5 eye socket.

6 A Yes.

7 Q And she continues to have GI problems?

8 A Yes, she does.

9 Q She's fed by a feeding tube?

10 A Yes.

11 Q She eats gluten-free, casing-free crackers,
12 and water by mouth, only?

13 A Yes.

14 Q Does she continue to have diarrhea?

15 A Yes.

16 Q Does she continue to vomit?

17 A She doesn't vomit as frequently as before.

18 Q But she still has occasional episodes?

19 A Occasionally, yes.

20 Q She's under treatment for a seizure
21 disorder?

22 A Yes.

23 Q And she's currently receiving Keppra, 200
24 milligrams?

25 A Yes.

1 Q And she has break-through seizures?

2 A Yes.

3 Q When she has the break-through seizures, you
4 give her Valium to control the seizures?

5 A Right, yes.

6 Q Does she still have arthritis?

7 A Yes, she does.

8 Q We saw that Michelle was in a wheelchair
9 today. Is she able to walk?

10 A She's able to walk with assistance. But she
11 needs a lot of help walking. She'd be a real high
12 risk to fall and break something else if we were to
13 let her go on her own. So on some days, it's very
14 painful for her to walk.

15 Q She is under treatment for all these
16 problems?

17 A Yes, she is.

18 Q Has anybody told you what Michelle's
19 prognosis is?

20 A No, nobody has.

21 MS. CHIN-CAPLAN: I have no further
22 questions, Special Master.

23 SPECIAL MASTER HASTINGS: Thank you. Thank
24 you very much. We had discussed earlier that Ms.
25 Chin-Caplan -- would you stay there just for a minute,

1 Mrs. Cedillo -- that Ms. Chin-Caplan will have some
2 additional questions for Mrs. Cedillo tomorrow
3 concerning the video, is that correct? So we decided
4 we would take the rest of her testimony, and then
5 she'll testify again concerning some video.

6 I think I'm going to take the opportunity
7 right now. I just had a few clarifying questions for
8 you, Mrs. Cedillo.

9 THE WITNESS: Sure.

10 SPECIAL MASTER HASTINGS: I understand
11 there's a problem with the microphone.

12 THE WITNESS: The light went off awhile ago,
13 but I thought --

14 SPECIAL MASTER HASTINGS: Is it back on?

15 THE WITNESS: No, here, hold on, it says,
16 "push," Here it goes. Is that better?

17 SPECIAL MASTER HASTINGS: Yes.

18 THE WITNESS: Okay, here you go.

19 SPECIAL MASTER HASTINGS: Is that better
20 there?

21 THE WITNESS: Okay.

22 SPECIAL MASTER HASTINGS: I just wanted to
23 ask you, Mrs. Cedillo, a very few questions here to
24 clarify some points in the record.

25 THE WITNESS: Okay.

1 SPECIAL MASTER HASTINGS: Obviously, you've
2 been through a great deal here, and we hate to force
3 you to talk about such difficult topics. But we
4 appreciate you being here and being willing to talk
5 with us. So I just have a few more questions.

6 You have made a number of statements in the
7 record here, and I just wanted to ask you a few
8 questions about them, just to find out exactly under
9 what circumstances those statements were made.

10 So perhaps it would be helpful if somebody
11 could put in from of Mrs. Cedillo a copy of Exhibit
12 18. I don't know if you've got it there. I'm going
13 to be talking about Exhibits 18, 21, and 54, which are
14 three documents that contain statements by Mrs.
15 Cedillo.

16 MR. HOMER: Exhibits 19, 54, and what was
17 the third one, sir?

18 SPECIAL MASTER HASTINGS: Exhibits 18, 21,
19 and 54 -- you've got 18. We'll start with that one.

20 THE WITNESS: Thank you.

21 SPECIAL MASTER HASTINGS: If you'll look at
22 18, on 18, the first page of it, is a vaccine
23 administration record. I'm looking at the second
24 page.

25 THE WITNESS: Okay.

1 SPECIAL MASTER HASTINGS: It says,
2 "Michelle, observations."

3 THE WITNESS: Observations, okay.

4 SPECIAL MASTER HASTINGS: Can you tell me
5 about how you came to make these observations; or if
6 someone asked you to, or when did you start doing
7 this?

8 THE WITNESS: These were made after this
9 time had gone by. I was asked to make chronology of
10 her behaviors prior and following the vaccination.

11 SPECIAL MASTER HASTINGS: Okay, so when it
12 says 3/18/97 --

13 THE WITNESS: Yes.

14 SPECIAL MASTER HASTINGS: -- this record was
15 made by you on March 18, 1997. Is that correct?

16 THE WITNESS: Let me look at it for a
17 minute.

18 SPECIAL MASTER HASTINGS: Okay, sure.

19 THE WITNESS: Because I've actually made
20 several narratives.

21 SPECIAL MASTER HASTINGS: Right.

22 THE WITNESS: And I want to make sure that
23 I'm telling you about the right one.

24 SPECIAL MASTER HASTINGS: Go ahead and take
25 your time.

1 THE WITNESS: Okay, if she was two and-a-
2 half, then, yes, 3/18, that's my first statement.
3 She's two and-a-half years old. So this would have
4 been made on or close to that 3/18/97 date.

5 SPECIAL MASTER HASTINGS: Okay, then if you
6 flip over to page three.

7 THE WITNESS: Okay.

8 SPECIAL MASTER HASTINGS: That's the third
9 page of those observations.

10 THE WITNESS: Okay.

11 SPECIAL MASTER HASTINGS: It's toward the
12 bottom. It says, "4/24/97".

13 THE WITNESS: Yes.

14 SPECIAL MASTER HASTINGS: Then it says,
15 "Today I am writing additional comments."

16 THE WITNESS: Okay.

17 SPECIAL MASTER HASTINGS: Are you with me
18 there?

19 THE WITNESS: Yes, I am.

20 SPECIAL MASTER HASTINGS: Then it says, "I
21 am writing additional comments, observations for any
22 doctors, psychologists, or therapists that want a
23 history of her development."

24 THE WITNESS: Yes.

25 SPECIAL MASTER HASTINGS: Then you provide a

1 history of Michelle's condition, up to that time.

2 THE WITNESS: Yes.

3 SPECIAL MASTER HASTINGS: So if I
4 understand, you made this. You wrote these out on
5 April 24, 1997.

6 THE WITNESS: Yes.

7 SPECIAL MASTER HASTINGS: All right, now let
8 me see, the next one then, and you can close that one
9 up.

10 THE WITNESS: Okay.

11 SPECIAL MASTER HASTINGS: This won't be
12 long.

13 THE WITNESS: That's okay.

14 SPECIAL MASTER HASTINGS: Exhibit 21, do you
15 have that in front of you?

16 THE WITNESS: Let me see -- yes, for Good
17 Samaritan?

18 SPECIAL MASTER HASTINGS: Yes, correct.

19 THE WITNESS: Okay, yes.

20 SPECIAL MASTER HASTINGS: Now turn through
21 that to page eight. There are big page numbers at the
22 bottom.

23 THE WITNESS: Okay, there are numbers, okay.

24 SPECIAL MASTER HASTINGS: There are big page
25 numbers at the bottom middle of the page.

1 THE WITNESS: Yes.

2 SPECIAL MASTER HASTINGS: Then on page eight
3 at the top, it says "narrative."

4 THE WITNESS: Yes.

5 SPECIAL MASTER HASTINGS: Okay, and it gives
6 your name as the author of this. I didn't see here
7 where there was anywhere on here as to when you wrote
8 this narrative. Do you have any idea?

9 THE WITNESS: Okay, let me look at it for a
10 minute and see.

11 SPECIAL MASTER HASTINGS: Okay, yes, take
12 your time, please.

13 THE WITNESS: No, I don't have. I'm going
14 to take a guess that it might have been early after I
15 first filed; and the attorney prior to this, I think
16 was Phil Fleming, before we went with Kevin.

17 SPECIAL MASTER HASTINGS: Okay.

18 THE WITNESS: He may have asked. I think
19 usually when this happened at this date, someone had
20 asked me for a brief narrative of what had happened.
21 All I can think of at this time, who would have wanted
22 to know about this particular timeframe may have been
23 when we first filed.

24 SPECIAL MASTER HASTINGS: Okay.

25 THE WITNESS: But I'm guessing, and I don't

1 know why. I usually dated everything, but there is no
2 date on here.

3 SPECIAL MASTER HASTINGS: Now if you flip
4 over then, the narrative goes pages eight, nine, ten,
5 eleven, and twelve.

6 THE WITNESS: Yes.

7 SPECIAL MASTER HASTINGS: Page 12 being
8 additional notes.

9 THE WITNESS: Additional notes -- this might
10 help me. I'm sorry, go ahead.

11 SPECIAL MASTER HASTINGS: Go ahead. Take
12 your time and take a look at that.

13 THE WITNESS: Because this might give me an
14 idea of when exactly.

15 SPECIAL MASTER HASTINGS: Yes.

16 THE WITNESS: Okay, see, I refer to the
17 upper endoscopy in 2000.

18 SPECIAL MASTER HASTINGS: Yes.

19 THE WITNESS: So this was probably written
20 around that time. Maybe it was written for the study
21 that she was in, the secretin study.

22 SPECIAL MASTER HASTINGS: Yes.

23 THE WITNESS: But generally, when someone
24 asked me for a narrative, that's when I would write
25 something like this, because the old ones were really

1 old, so I had to re-do then. The only things I can
2 think of would have been for the filing or maybe for a
3 study. Usually I was specifically asked to write it.

4 SPECIAL MASTER HASTINGS: Okay, thank you,
5 then if you flip to the next page.

6 THE WITNESS: Yes.

7 SPECIAL MASTER HASTINGS: Pages 13, 14, and
8 15.

9 THE WITNESS: Yes.

10 SPECIAL MASTER HASTINGS: At page 13, it
11 says these are records of dosages, giving Tylenol to
12 Michelle Cedillo.

13 THE WITNESS: Yes.

14 SPECIAL MASTER HASTINGS: Then there are
15 three pages of notations of medications. Is that your
16 handwriting?

17 THE WITNESS: Yes, it is.

18 SPECIAL MASTER HASTINGS: Okay, so are these
19 notes that were actually made on the dates in
20 question?

21 THE WITNESS: These were made on those
22 dates, and I found them at a later date.

23 SPECIAL MASTER HASTINGS: Okay.

24 THE WITNESS: I didn't even realize I had
25 then until a later date.

1 SPECIAL MASTER HASTINGS: All right, so you
2 used these notes, these little three pages of notes --
3 13, 14, and 15 -- to help you write the narrative.

4 THE WITNESS: Yes, I did.

5 SPECIAL MASTER HASTINGS: Now did you have
6 anything else that helped you write the narrative?
7 Because obviously, you are doing this after the year
8 2000 or later, and there's a lot of detail about each
9 of these days from December 28th through January 6th.

10 THE WITNESS: Yes, I did. I relied on my
11 old calendars from that time.

12 SPECIAL MASTER HASTINGS: Okay, so you had
13 written notes on the calendar?

14 THE WITNESS: Yes, I did; and, in fact,
15 there's the narrative part that we just looked at
16 prior to this one. I actually made an error, and when
17 I went back and looked, I think I said she got the
18 fever on the fourteenth day. She actually got it on
19 the seventh day.

20 But once I looked, then I always wrote the
21 seventh day. I don't even think at that point I
22 realized I had the calendar. Then when I went back
23 and tried to find it, then I realized it was the
24 seventh day. So if you see that, that's why that's
25 there.

1 SPECIAL MASTER HASTINGS: So flipping over
2 then to page 16, that seems to refer to that, back
3 here.

4 THE WITNESS: Okay.

5 SPECIAL MASTER HASTINGS: It looked like
6 this narrative was done, probably this last page, 16,
7 was done shortly after you did the other pages.

8 THE WITNESS: Okay, let me see.

9 SPECIAL MASTER HASTINGS: But take a look at
10 that, because it mentions the calendar there.

11 THE WITNESS: Yes, I see that. But I
12 actually had forgotten about that; on page 16?

13 SPECIAL MASTER HASTINGS: Right, it mentions
14 the calendar there.

15 THE WITNESS: It mentions the calendar, and
16 I had forgotten about the event on the 23rd, which
17 would have been the third day after the vaccination.

18 SPECIAL MASTER HASTINGS: Okay, now I wanted
19 to ask you about that calendar, and I hadn't found a
20 copy of that calendar anywhere in the record. We
21 asked your counsel to talk to you about that and see
22 if you could bring it.

23 THE WITNESS: Yes, I made copies and they
24 have them.

25 SPECIAL MASTER HASTINGS: Okay, we'd like to

1 take a brief look at when we're done here --

2 THE WITNESS: Yes, that's fine.

3 SPECIAL MASTER HASTINGS: -- along with the
4 counsel for both sides.

5 THE WITNESS: Okay.

6 SPECIAL MASTER HASTINGS: The third document
7 I wanted to ask you about is Exhibit 54.

8 THE WITNESS: Okay.

9 SPECIAL MASTER HASTINGS: Have they given
10 you a copy of that, Mrs. Cedillo?

11 THE WITNESS: Yes.

12 SPECIAL MASTER HASTINGS: That one does give
13 us a date of when you swore to this, and this was
14 2001.

15 THE WITNESS: Okay.

16 SPECIAL MASTER HASTINGS: I guess the only
17 question I was going to ask you, and it's got a date,
18 so that's obvious, when you signed this --

19 THE WITNESS: Okay.

20 SPECIAL MASTER HASTINGS: -- when you signed
21 this, do you have any idea whether this one we just
22 talked about, Exhibit 21, which is not dated but
23 clearly was done in 2000 or thereafter because of the
24 notation of the 2000 incident -- I guess the endoscopy
25 in 2000 -- do you have any idea whether you did this

1 statement that was Exhibit 21 before the affidavit
2 that's Exhibit 54?

3 THE WITNESS: Let me look at it real quick,
4 okay, because I can probably tell by what she had
5 wrong with her. Let me look at this one real quick.

6 SPECIAL MASTER HASTINGS: Okay, yes, take
7 your time, please.

8 THE WITNESS: Okay, this looks like it's
9 just of that short timeframe following the vaccine.
10 Let me look at this one. It was page eight, right, on
11 21? I think it was page eight.

12 SPECIAL MASTER HASTINGS: Well, I'm not sure
13 what you're asking me, Mrs. Cedillo.

14 THE WITNESS: Oh, I'm sorry. We're
15 comparing Exhibit 21, page eight, to Exhibit 54.

16 SPECIAL MASTER HASTINGS: Right, yes.

17 THE WITNESS: Okay.

18 SPECIAL MASTER HASTINGS: Yes, page eight of
19 the exhibit. That's correct.

20 THE WITNESS: Okay, let me see.

21 SPECIAL MASTER HASTINGS: David, do you have
22 a copy of this for Mrs. Cedillo, as well? Do you have
23 the other copy of this? Why don't you come and take
24 one of ours? We can look together here.

25 THE WITNESS: Special Master Hastings?

1 SPECIAL MASTER HASTINGS: Yes.

2 THE WITNESS: I'm not certain. I still
3 can't pinpoint the timeframe of this.

4 SPECIAL MASTER HASTINGS: Okay.

5 THE WITNESS: I think they were very close,
6 though.

7 SPECIAL MASTER HASTINGS: Okay.

8 THE WITNESS: Because I mentioned the 2000
9 scope being in this Exhibit 21. But then this Exhibit
10 54, it only goes up to that certain point.

11 SPECIAL MASTER HASTINGS: Okay, well, that's
12 fine. That's all I need to know. I want to ask you
13 one more question then.

14 THE WITNESS: Okay.

15 SPECIAL MASTER HASTINGS: I guess my law
16 clerk just put in front of you some xerox pages off
17 the calendar.

18 THE WITNESS: Yes.

19 SPECIAL MASTER HASTINGS: He photocopied
20 those.

21 THE WITNESS: Yes.

22 SPECIAL MASTER HASTINGS: Can you look at
23 those?

24 THE WITNESS: Yes, I can.

25 SPECIAL MASTER HASTINGS: So is that an

1 accurate photocopy of the data on your calendar --

2 THE WITNESS: Yes, it is.

3 SPECIAL MASTER HASTINGS: -- that you relied
4 upon this to make that first narrative?

5 THE WITNESS: Yes, it is.

6 SPECIAL MASTER HASTINGS: Okay, the other
7 set of notes, we already saw about the medication,
8 plus these notes, those were the notes you made
9 contemporaneously at the time of the incident?

10 THE WITNESS: Yes.

11 SPECIAL MASTER HASTINGS: And the rest of
12 what was in the first narrative came from your memory.

13 THE WITNESS: That's correct, as far as I
14 know. I mean, I'm trying to think what else I would
15 have relied on. But it would have been these notes
16 showing the times, and these notes showing the dates -
17 - the handwritten, the little ones.

18 SPECIAL MASTER HASTINGS: Right, okay,
19 that's all I need.

20 THE WITNESS: Okay.

21 SPECIAL MASTER HASTINGS: I think it would
22 be helpful, counsel, for the Petitioners -- the notes
23 of the medication are already in the record, as I just
24 went over. The notes from the calendar were not. I
25 know Cedillo family would want to keep that calendar

1 and take it back with them, and not get it out of
2 their hands.

3 But if you could place a photocopy of this
4 calendar into the record, it might be helpful if we
5 need clarification on the chronology. Then let me
6 see, I think I just had one more question.

7 THE WITNESS: Okay.

8 SPECIAL MASTER HASTINGS: Ms. Chin-Caplan
9 did a very good job going over Michelle's medical
10 history with you. I wanted to ask about one thing.

11 THE WITNESS: Okay.

12 SPECIAL MASTER HASTINGS: We talked today a
13 little bit certainly about the two incidents of high
14 fever after the MMR vaccination, and we have in the
15 record of when you took Michelle to the pediatrician
16 on January 6th.

17 THE WITNESS: Yes.

18 SPECIAL MASTER HASTINGS: Then we had
19 another record where you went back to the pediatrician
20 two months later in March of 1996. On that one, it
21 notes that Michelle was talking less.

22 THE WITNESS: Yes.

23 SPECIAL MASTER HASTINGS: Now I noticed in
24 the medical record that that was the last medication
25 record that we were able to find; and of course, we

1 had thousands of pages of them.

2 THE WITNESS: Yes.

3 SPECIAL MASTER HASTINGS: But that was the
4 last one we could find for about year. The next one
5 was March of 1997.

6 THE WITNESS: Yes.

7 SPECIAL MASTER HASTINGS: I just wanted to
8 make clear that there weren't any medical visits
9 during that year.

10 THE WITNESS: That's correct; not until I
11 think it's April of the next year. That's correct.

12 SPECIAL MASTER HASTINGS: I just wanted to
13 clarify that.

14 THE WITNESS: Okay.

15 SPECIAL MASTER HASTINGS: So that's all that
16 I have.

17 THE WITNESS: Okay.

18 SPECIAL MASTER HASTINGS: Again, I want to
19 thank you for testifying about this really terrible
20 time in your life. We appreciate it very much.

21 With that counsel, should we adjourn for the
22 day, and then take up tomorrow with your direct
23 examination of Mrs. Cedillo about the video?

24 MS. CHIN-CAPLAN: Yes, Special Master.

25 SPECIAL MASTER HASTINGS: Is that okay, Mr. Matanoski?

1 MR. MATANOSKI: Yes, sir.

2 SPECIAL MASTER HASTINGS: Is there anything
3 we should talk about before we adjourn today?

4 MR. HOMER: Yes, sir, this is Mr. Homer.
5 Special Master Vowell, we had a question for Dr.
6 Aposhian regarding the mortality rate. It's at
7 Petitioner's Exhibit L, the Dali (phonetic) article.
8 It's on page 292, the first paragraph.

9 SPECIAL MASTER VOWELL: Great, thank you
10 very much.

11 MR. HOMER: You're welcome.

12 SPECIAL MASTER HASTINGS: There's one more
13 item then, Ms. Cedillo, that we'll go back over with
14 your husband.

15 THE WITNESS: Okay.

16 SPECIAL MASTER HASTINGS: And we thank you
17 again.

18 THE WITNESS: Okay, thank you.

19 SPECIAL MASTER HASTINGS: There is one more
20 housekeeping matter. I wanted to go over this before
21 we adjourn for the day. We had had requests from
22 other counsel who were following the case today by e-
23 mail, to get the list of the witnesses, for
24 information for those who were following along with
25 this case.

1 The list of the witnesses and the actual
2 reports were filed into the file of the Cedillo case
3 itself long ago, or at least several months ago in
4 both cases. But they have not yet been made a matter
5 of public record. Neither side wanted to make those
6 witness lists available up until now.

7 We have now got agreement today to put the
8 list of the witnesses with their specialties. We'll
9 put some kind of an order onto the autism master file
10 and the web site, listing the names and the
11 specialties of those witnesses.

12 I won't go over them now, but for those of
13 you who are following along, tomorrow we are going to
14 be having more testimony from Mrs. Cedillo, and then
15 we're going to have the testimony of Dr. Arthur
16 Krigsman, the gastroenterologist who was mentioned
17 today. We will get, tonight or tomorrow, for purposes
18 of anyone who wants to follow along, the list of the
19 expert witnesses for both sides.

20 The plan again, as we mentioned before, was
21 that the Petitioner's experts will be testifying this
22 week, and then we'll begin with the Respondent's
23 experts next week.

24 We have a rough order that was provided for
25 those witnesses today, and we're not holding anyone to

1 this in stone. But I believe the Petitioners
2 anticipate that Dr. Kennedy and/or Hepner will be
3 testifying on Wednesday, Dr. Byers on Thursday of this
4 week, and Dr. Kinsbourne on Friday of this week. Is
5 that right, Ms. Chin-Caplan? Did I get that right?

6 MS. CHIN-CAPLAN: That's correct, Special
7 Master.

8 SPECIAL MASTER HASTINGS: And then next
9 week, if we get through all the Petitioners experts
10 this week, the Respondent will be meeting with Dr.
11 Fombonne on Monday, and perhaps Dr. Wiznitzer on
12 Tuesday.

13 We will be getting more word from the
14 Respondent tomorrow on the order of their expert
15 witnesses. But I wanted to get that information out
16 to whoever is interested in it, if they want to plan
17 when they will listen in or when they'll visit us, et
18 cetera.

19 With that, I want to thank everyone who
20 participated in a long day today. It's one day down
21 and 14 to go, I guess. But everyone did a fine job
22 today, and I thank everyone for being here. We're
23 going to start again tomorrow at 9:00 a.m. We will
24 see you all then; good day.

25 //

1 (Whereupon, at 5:20 p.m., the hearing in the
2 above-entitled matter was adjourned.)
